Draft Chemical Composition of Munitions Report

1. INTRODUCTION

The National Guard Bureau (NGB) and the Massachusetts Army National Guard (MAARNG) were directed by the Deputy Undersecretary of Defense for Environmental Security (DUSD(ES)) in July 1996 to study the effects of military operations on the groundwater beneath the Impact Area at the Massachusetts Military Reservation (MMR). An action plan for the study was prepared in consultation with the U.S. Environmental Protection Agency Region I and other regulatory agencies to determine whether the past activities at the training range and Impact Area have affected, or have the potential to affect, groundwater quality. The study is in partial fulfillment of the requirements of EPA Administrative Order SDWA I-97-1019.

MMR has a long history of use, dating back to 1911, its most intensive use occurring during and immediately after World War II. Because more than 40 years of military and law enforcement training has been conducted on the training range at MMR, the first task in this study was a search of the MMR archives and records, applicable reference sources, and interviews to document the historical use and chemical composition of munitions used in the Impact Area.

This report summarizes the findings of the search, and is presented with a companion report on the historical training range use, to provide the background for the assessment of the impact of military operations on the groundwater beneath the Impact Area.

This report will focus on describing the chemical composition of munitions as defined by available databases and technical manuals. The goal of the analysis is to identify the chemicals that may be encountered on the Training Range.

It should be noted that the range of munitions used at MMR is not known with certainty. While good records exist for the recent past, these records are rather general. For example, the records refer to the weapons used rather than the specific munition. In response to this, attempts were made to identify any munitions that might be used in the weapon. More importantly, rates of use for the more distant past are not available. This suggests that munitions may have been used that have not been identified in this document. Attempts were made to define the general trends in munitions composition in the past.

2. BACKGROUND ON MUNITIONS COMPOSITION

A general discussion of the types and chemical composition of munitions used by the military is provided in this section as a basis for discussing the specific chemical contaminants that may have been generated either historically or recently as part of training exercises in the MMR Impact Area.

17th Chemical Comparison of Materials Report

INTRODUCTION

DISCLAIMER:

This document has been prepared pursuant to a government administrative order (U.S. EPA Region I SDWA Docket No. I-97-1019) and is subject to approval by the U.S. Environmental Protection Agency. The opinions, findings, and conclusions expressed are those of the authors and not necessarily those of the U.S. Environmental Protection Agency.

This report summarizes the findings of the study and is prepared with a disclaimer. The disclaimer states that the study was conducted for the purpose of providing information to the public and is not intended to be used for any other purpose. The study was conducted by the authors and is not intended to be used for any other purpose. The study was conducted by the authors and is not intended to be used for any other purpose.

2. SUMMARY OF STUDY OBJECTIVES

The study was conducted to determine the chemical composition of the materials and to compare the results with the results of the previous study. The study was conducted by the authors and is not intended to be used for any other purpose. The study was conducted by the authors and is not intended to be used for any other purpose.

Draft Chemical Composition of Munitions Report

1. INTRODUCTION

The National Guard Bureau (NGB) and the Massachusetts Army National Guard (MAARNG) were directed by the Deputy Undersecretary of Defense for Environmental Security (DUSD(ES)) in July 1996 to study the effects of military operations on the groundwater beneath the Impact Area at the Massachusetts Military Reservation (MMR). An action plan for the study was prepared in consultation with the U.S. Environmental Protection Agency Region I and other regulatory agencies to determine whether the past activities at the training range and Impact Area have affected, or have the potential to affect, groundwater quality. The study is in partial fulfillment of the requirements of EPA Administrative Order SDWA I-97-1019.

MMR has a long history of use, dating back to 1911, its most intensive use occurring during and immediately after World War II. Because more than 40 years of military and law enforcement training has been conducted on the training range at MMR, the first task in this study was a search of the MMR archives and records, applicable reference sources, and interviews to document the historical use and chemical composition of munitions used in the Impact Area.

This report summarizes the findings of the search, and is presented with a companion report on the historical training range use, to provide the background for the assessment of the impact of military operations on the groundwater beneath the Impact Area.

This report will focus on describing the chemical composition of munitions as defined by available databases and technical manuals. The goal of the analysis is to identify the chemicals that may be encountered on the Training Range.

It should be noted that the range of munitions used at MMR is not known with certainty. While good records exist for the recent past, these records are rather general. For example, the records refer to the weapons used rather than the specific munition. In response to this, attempts were made to identify any munitions that might be used in the weapon. More importantly, rates of use for the more distant past are not available. This suggests that munitions may have been used that have not been identified in this document. Attempts were made to define the general trends in munitions composition in the past.

2. BACKGROUND ON MUNITIONS COMPOSITION

A general discussion of the types and chemical composition of munitions used by the military is provided in this section as a basis for discussing the specific chemical contaminants that may have been generated either historically or recently as part of training exercises in the MMR Impact Area.

DISCLAIMER:

This document has been prepared pursuant to a government administrative order (U.S. EPA Region I SDWA Docket No. I-97-1019) and is subject to approval by the U.S. Environmental Protection Agency. The opinions, findings, and conclusions expressed are those of the authors and not necessarily those of the U.S. Environmental Protection Agency.

Draft Chemical Composition of Munitions Report

Generally, munitions are composed of energetic materials or chemicals that can be divided into three categories: explosives, propellants, and pyrotechnic. There are considerable variations among the properties of the compounds that constitute these three classes of energetic materials. A summary of physical and chemical properties of these compounds is provided below.

2.1 Explosives

Explosive materials have the potential to chemically change from the solid state to large volumes of hot gases very quickly. High Explosives (HE) are materials that undergo that change at a rate faster than the speed of sound. Examples of such materials are TNT, Amatol, and mercury fulminate. Low explosives (LE), such as black powder, smokeless powder, and rocket propellant, are those materials that undergo the change at speeds slower than the speed of sound. A list of commonly used explosives is provided in Table 2-1.

The variation in the properties of explosives is put to use in armaments (explosive rounds) by an arrangement known as the "Explosive Train" - an arrangement of elements according to decreasing sensitivity and increasing potency. The primary explosive usually constitute the initiator (heat, spark, impactor, friction) of the train. The second element, the booster, usually contains a less sensitive material that is a high explosive. The third and final component, the bursting charge, and consists of a secondary explosive. Each of these elements introduces a unique combination of chemical constituents to the armament. A more comprehensive discussion of the composition, size, and application of explosives used by the military is provided in Appendix A - Explosives and Demolitions (U.S. Army Field Manual 5-250, June 1992).

2.2 Propellants

Propellants are divided into the following categories based on composition:

- a) Single-based compositions contain nitrocellulose as the chief ingredient, and may contain inorganic nitrates, nitro-compounds, and non-explosive compounds, such as metals, metallic salts, carbohydrates, and dyes.
- b) Double-based composition generally applies to compositions containing both nitrocellulose and nitroglycerin. Like the single-based propellants, double-based propellants usually contain additives.
- c) Triple-based composition applies to propellants containing three explosive ingredients with nitroguanidine as the primary ingredient, in addition to components of this class of propellants.
- d) Mixed nitrate esters or composite propellants are a class of propellant generated by mixing and matching the other three classes of propellants; all usually have the same

Draft Chemical Composition of Munitions Report

components except for nitroguanidine. This class of propellants were developed primarily as a replacement for the triple-based propellants.

Single-based propellants are used in cannons, small arms, and grenades; double-based compositions are used in cannons, small arms, mortars, rockets and jet propulsion units; and triple-based propellants are used exclusively in cannon units. Composite propellants are used primarily in rocket assemblies and propulsion units. The choice of propellant is based on ballistic and physical requirements, and a given propellant composition could be suitable for several applications. Common propellants used by the military are listed in Table 2-2.

2.3 Pyrotechnics

Pyrotechnic compositions are divided into the following categories based on use:

- a) Flare and Signals which burn to produce light for illumination. Signals produce colored flames that are used as semaphores.
- b) Colored and White Smoke for signaling.
- c) Tracers and Fumers are used as small smoke producing charges placed in projectiles; and used to track the flight of the projectile. Fumers are used to produce smoke at the proper time to fill vacuums created behind the projectile so as to reduce the drag on the projectile.
- d) Incendiaries produce large amounts of heat for the purpose of causing fires.
- e) Delays and Fuses are designed to burn for a predetermined time, and used to provide an interval between ignition and detonation of an explosive. A delay is an explosive igniter that consists of an initiator, a delay column, and an output charge and a fuse is a length of cord made of flammable material attached to a device to provide the same effect.
- f) Photoflash Composition is a loose mixture of oxidizers and metallic fuels that, when ignited, burns with explosive violence in a very short time. Photoflashers are used for military aerial photography.
- g) Igniters and Initiators are used to ignite propellants and initiate detonation of explosive charges.

(Table 2-3 lists pyrotechnics known to have been used in the MMR Impact Area)

Draft Chemical Composition of Munitions Report

**TABLE 2-1:
COMMONLY USED EXPLOSIVES**

| <u>NAME</u> | <u>DESCRIPTION</u> | <u>REMARKS</u> |
|---------------|--|--|
| BLACK POWDER | BROWN TO BLACK | MANUFACTURED IN GRAINS THAT RANGE IN SIZE FROM SMALLER THAN SALT GRAINS TO GRAINS AS LARGE AS SMALL PEBBLES. HIGHLY SENSITIVE TO IGNITION BY HEAT, FRICTION, FLAME, SPARK. WHEN WET, IT IS CORROSIVE TO MOST METALS. |
| TNT | LIGHT YELLOW TO BROWN OR GRAY | LIGHTLY CORROSIVE WITH LEAD. USED IN BOMBS, GRENADES, DEMOLITION CHARGES, PROJECTILES. EXUDES AT ELEVATED TEMPERATURES. MODERATELY TOXIC BY SKIN ABSORPTION OR INHALATION. |
| EXPLOSIVE D | BRIGHT YELLOW TO ORANGE. ALSO CALLED AMMONIUM PICRATE. | RELATIVELY INSENSITIVE. HIGHLY TOXIC BY INHALATION, INGESTION, OR SKIN ABSORPTION |
| AMATOL | LIGHT BROWN TO YELLOW/MIXTURE OF TNT AND EXPLOSIVE D | SLIGHT HYGROSCOPIC. HAS CORROSIVE EFFECTS ON COPPER, BRONZE, LEAD, BRASS. HIGHLY TOXIC BY INHALATION, SKIN CONTACT, INGESTION. |
| COMPOSITION B | WHITE TO BROWNISH YELLOW, MIXTURE OF TNT AND EXPLOSIVE D | SLIGHTLY CORRODES COPPER, BRASS, CADMIUM, ZINC. USED IN BOMBS, PROJECTILES, GRENADES, SHAPED CHARGES. |
| OCTOL | LIGHT BROWN | USED IN BOMBS, PROJECTILES, SHAPED CHARGES. |

Draft Chemical Composition of Munitions Report

TABLE 2-1 (continued)
COMMONLY USED EXPLOSIVES

| <u>NAME</u> | <u>DESCRIPTION</u> | <u>REMARKS</u> |
|----------------------|----------------------------------|--|
| RDX | WHITE. ALSO CALLED CYCLONITE | SENSITIVE TO IMPACT AND FRICTION. SLIGHTLY CORROSIVE WITH COPPER, BRASS, MILD STEEL, CADMIUM. MODERATELY TOXIC BY INHALATION OR INGESTION. |
| HMX | WHITE. ALSO CALLED OCTOGEN | SENSITIVE TO IMPACT AND FRICTION. SLIGHTLY TOXIC. |
| PETN | WHITE | SENSITIVE TO IMPACT. SLIGHTLY CORROSIVE TO BRASS, CADMIUM, ZINC. VERY SLIGHTLY TOXIC. |
| LEAD AZIDE | WHITE TO LIGHT BROWN | VERY SENSITIVE TO IMPACT, FRICTION, SPARKS. CORROSIVE TO COPPER, ZINC. VERY SLIGHTLY TOXIC. |
| LEAD STYPHNATE | LIGHT ORANGE TO REDDISH BROWN | SAME AS LEAD AZIDE. |
| MERCURY FULMINATE | GRAYISH | VERY SENSITIVE TO IMPACT, FRICTION, SPARKS. CORROSIVE TO ALUMINUM, MAGNESIUM, COPPER, BRONZE, COPPER, ZINC, BRASS. HIGHLY TOXIC THROUGH SKIN ABSORPTION, INHALATION, INGESTION. SYMPTOMS RESEMBLE MERCURY POISONING. |

| <u>SYMBOL</u> | <u>COMMON NAME</u> | <u>VISUAL IDENTIFICATION</u> | <u>ACTION</u> |
|---------------|--------------------|------------------------------|--------------------------------|
| CS | NONE | WHITE CRYSTALLINE SOLID | TEAR AGENT |
| HC | HEXACHORO-ETHANE | WHITE SOLID | SCREENING SMOKE |
| WP | WHITE PHOSPHOROUS | PALE YELLOW SOLID | SCREENING SMOKE AND INCENDIARY |
| RP | RED PHOSPHOROUS | REDDISH BROWN POWDER | SCREENING SMOKE |

Draft Chemical Composition of Munitions Report

3. METHODOLOGY

Available sources of information on the types of munitions used in weapons fired at MMR and the structural and chemical composition of these munitions included:

- MMR munitions use records,
- MMR range manuals,
- technical and field manuals on the used of military explosives and demolitions,
- conversations with personnel familiar with training operations and exercises conducted at MMR, and
- conversations with personnel familiar with military weapons and munitions.

Because a comprehensive list of the types and quantities of munitions used in the Impact Area throughout its history is not available, the munitions utilization reports from 1989 and 1994 through 1996 were used to generate a list of munitions used in recent years within the Impact Area. Additions to the list were compiled through the review of life cycle reports and technical manuals provided by the Ammunition Supply Point. Other sources of information included the review of training range standard operating procedures (SOPs), an MMR training range facilities report, range safety regulations, and range use histories (provided in the companion report). The munitions summary list was further supplemented with information gather from discussions with personnel at the Unified Environmental Planning Office (UEPO), the MMR range control office, the Army office of the Brigadier General, Picatinny Arsenal, the Waterways Experiment Station, and the Cold Regions Research Laboratory. Telephone conversation and interview logs sheets are provided in Appendix B.

Due to data availability, the information presented below is focused on munitions that are generally currently in use. A variety of weapons, and their associated munitions, which have been used at MMR in the past are not in current use. In order to ascertain how representative the chemical content of these munitions is to historically employed munitions, a number of phone calls were placed to Picatinny Arsenal (see telephone communication summaries for Bunting, Suarez, and Walch in Appendix B). The engineers at Picatinny indicated that the composition of projectiles (i.e., bullets), explosives, primers, and casings are very likely to be stable over the last number of decades. For example, bullets for a variety of weapons are composed of similar materials and those materials have been used for many years. There have been changes in the composition of projectiles in recent years in an attempt to achieve better penetrating capability. Such new munitions are not likely to be used on a training range due to their high cost. The quality of propellents has changed over the years as different manufacturers use different mixtures and as the Army has required greater range out of it's munitions. Similarly, the composition of incendiary, light-, and smoke-generating materials have changed and continue to

Draft Chemical Composition of Munitions Report

evolve. The exception to this is the use of white and red phosphorous which has been common for many years.

There is little information available on the dates of manufacture for munitions. According to the training manual on military explosives (see Appendix A) prepared by the USAEC technical information center, the technology of explosives has constantly evolved over the last few centuries. Prior to World War I, the manufacture of TNT was a formalized process, but since then become controlled, highly guarded manufacturing process. Little documentation is thus available on the dates of manufacture. A search of the MIDAS database, the U.S. Technical Information Center (TIC) of Aberdeen Proving Ground, Army technical manuals, and discussions with several knowledgeable military personnel did not provide substantive information.

The primary source of information on the composition of munitions identified during the search was provided in the Munitions Items Disposition Action System (MIDAS) database. The MIDAS database was created by the the U.S. Army Defense Ammunition Center and School and tracks munitions by the Department of Defense Activity Code (DODAC) designations for each type. The database includes chemical composition of the various components (e.g. propellant, casing, projectile, and primer) for each munition.

The MIDAS data sheets include general information on the construction of each munition, but detailed construction and use specification information was compiled from from several Army Ammunition Data Sheets to supplement the MIDAS information.

Though the MIDAS database is the most complete source of information on munitions, it does not contain comprehensive information on the chemical composition of pyrotechnics (munitions that display light, smoke, or noise). General information on these munitions, contained in Section 2, was gathered from the Army Corps of Engineers Waterway Experiment Station and Cold Regions Research Laboratory.

Draft Chemical Composition of Munitions Report

4. FINDINGS

The list of munitions presumed to have been used in the Impact Area at MMR was compiled from the 1989 and 1994 through 1996 munitions utilization reports and supplemented with the various other sources of munitions presumed to be used at MMR.

The data sheets from a download from the MIDAS database are presented in Appendix C. Summary tables listing DODAC codes, weapons type, quantity used during a given year (1989), search results, and number of pages have been included in the download. It was not always possible to obtain a report for a given munition from MIDAS, as it appears that MIDAS is incomplete with respect to some DODAC codes. If the search was unsuccessful, this is reported in the tables contained in Appendix C. These tables are organized by DODAC code. The MIDAS report includes a complete listing of the chemical composition and physical parts of the respective munitions.

A subset of the MIDAS database was generated to identify the predominant compounds in each munition type. The composition of each component of each munition was screened to select all of the compounds present in excess of 10 percent (by weight) or that contain either lead or mercury. The resulting summary (Table 4-1) lists DODAC designation, munitions type, significant constituent compounds and their respective percent (by weight), and the weight of some individual constituents. Note that the chemical content of many munitions are very similar. For this reason, there is extensive cross-referencing among the various munitions in Table 4-1. Also note that no mercury containing materials were found in the search of the MIDAS database for the munitions identified.

The information in Table 4-1 has been sorted to arrive at a listing of the all of the unique names among the major components contained in that set of munitions (Table 4-2). These components are presented in alphabetical order. Contained in this list are several explosives (HMX, RDX, TNT, etc.); various dyes; metals contained in casings, projectiles, and as reactive agents; plastics used as casings; and a variety of miscellaneous organic chemicals (e.g., sugar, formaldehyde/melamin, lactose, etc.).

Information on munitions used at MMR was also obtained from US Army technical manuals on munitions and environmental life cycle analysis reports. The first of these documents include technical specifications and diagrams of the munitions. The technical specifications include the intended use of munition including the intended weapons and their application; technical data on composition of the various munitions components; and references to other sources of information. The sketches include dimensions of various components. Table 4-3 catalogs those documents that are available on MMR munitions. The table includes the munitions type, the

Draft Chemical Composition of Munitions Report

applicable weapon(s), a reference to the source materials, whether a MIDAS database report (Appendix C) was obtained, and the DODAC code listed for the munition. The full text of these documents are contained in Appendix D.

Finally, material was identified on the composition and toxicity of smoke-generating materials. These are provided as Appendix E.

Draft Chemical Composition of Munitions Report

APPENDIX A. EXPLOSIVES AND DEMOLITIONS REPORT

Chapter 1

Military Explosives

Section I. Demolition Materials

1-1. Characteristics. To be suitable for use in military operations, explosives must have certain properties. Military explosives—

- Should be inexpensive to manufacture and capable of being produced from readily available raw materials.
- Must be relatively insensitive to shock or friction, yet be able to positively detonate by easily prepared initiators.
- Must be capable of shattering and must have the potential energy (high energy output per unit volume) adequate for the purpose of demolitions.
- Must be stable enough to retain usefulness for a reasonable time when stored in temperatures between -80 and +165 degrees Fahrenheit.
- Should be composed of high-density materials (weight per unit volume).
- Should be suitable for use underwater or in damp climates.
- Should be minimally toxic when stored, handled, and detonated.

1-2. Selection of Explosives. Select explosives that fit the particular purpose, based on their relative power. Consider all characteristics when selecting an explosive for a particular demolition project. See Technical Manual (TM) 9-1300-214 for detailed information on military explosives. Table 1-1 (page 1-2) contains significant information regarding many of the explosives described below.

1-3. Domestic Explosives.

a. *Ammonium Nitrate.* Ammonium nitrate is the least sensitive of the military explosives. It requires a booster charge to successfully initiate detonation. Because of its low sensitivity, ammonium nitrate is a component of many composite explosives (combined with a more sensitive explosive). Ammonium nitrate is not suitable for cutting or breaching charges because it has a low detonating velocity. However, because of its excellent cratering effects and low cost, ammonium nitrate is a component of most cratering and ditching charges. Commercial quarrying operations use ammonium nitrate demolitions extensively. Pack ammonium nitrate in an airtight container because it is extremely hygroscopic (absorbs humidity). Ammonium nitrate or composite explosives containing ammonium nitrate are not suitable for underwater use unless packed in waterproof containers or detonated immediately after placement.

b. *Pentaerythrite Tetranitrate (PETN).* PETN is a highly sensitive and very powerful military explosive. Its explosive potential is comparable to cyclonite (RDX) and nitroglycerin. Boosters, detonating cord, and some blasting caps contain PETN. It is also used in composite explosives with trinitrotoluene (TNT) or with nitrocellulose. A PETN-nitrocellulose composite (M118 sheet explosive) is a demolition charge. The PETN explosive is a good underwater demolition because it is almost insoluble in water.

Table 1-1. Characteristics of US demolitions explosives

| Name | Applications | Detonation Velocity | | RE Factor* | Fume Toxicity | Water Resistance |
|-------------------------------------|--|---------------------|------------------|------------|---------------|------------------|
| | | M/Sec | Ft/Sec | | | |
| Black Powder | Time Fuse | 400 | 1,300 | 0.55 | Dangerous | Poor |
| Ammonium Nitrate | Cratering Charge | 2,700 | 8,900 | 0.42 | Dangerous | Poor |
| Amatol 80/20 | Bursting Charge | 4,900 | 16,000 | 1.17 | Dangerous | Poor |
| M1 Dynamite | Demolition Charge | 6,100 | 20,000 | 0.92 | Dangerous | Fair |
| Detonating Cord | Priming | 6,100 to 7,300 | 20,000 to 24,000 | — | Slight | Excellent |
| TNT | Demolition Charge Composition Explosive | 6,900 | 22,600 | 1.00 | Dangerous | Excellent |
| Tetrytol 75/25 | Demolition Charge | 7,000 | 23,000 | 1.20 | Dangerous | Excellent |
| Tetryl | Booster Charge Composition Explosive | 7,100 | 23,300 | 1.25 | Dangerous | Excellent |
| Sheet Explosive M118 and M186 | Cutting Charge | 7,300 | 24,000 | 1.14 | Dangerous | Excellent |
| Pentolite 50/50 | Booster Charge Bursting Charge | 7,450 | 24,400 | — | Dangerous | Excellent |
| Nitroglycerin | Commercial Dynamite | 7,700 | 25,200 | 1.50 | Dangerous | Good |
| Bangalore Torpedo, M1A2 | Demolition Charge | 7,800 | 25,600 | 1.17 | Dangerous | Excellent |
| Shaped Charges M2A3, M2A4, and M3A1 | Cutting Charge | 7,800 | 25,600 | 1.17 | Dangerous | Excellent |
| Composition B | Bursting Charge | 7,800 | 25,600 | 1.35 | Dangerous | Excellent |
| Composition C4 and M112 | Cutting Charge Breaching Charge | 8,040 | 26,400 | 1.34 | Slight | Excellent |
| Composition A3 | Booster Charge Bursting Charge | 8,100 | 26,500 | — | Dangerous | Good |
| PETN | Detonating Cord Blasting Caps Demolition Charges | 8,300 | 27,200 | 1.66 | Slight | Excellent |
| RDX | Blasting Caps Composition Explosives | 8,350 | 27,400 | 1.60 | Dangerous | Excellent |

*TNT equals 1.00

c. *Cyclotrimethylenetrinitramine (RDX)*. RDX is also a highly sensitive and very powerful military explosive. It forms the base charge in the M6 electric and M7 nonelectric blasting caps. When RDX is desensitized, it serves as a subbooster, booster, bursting charge, or demolition charge. The principal use for RDX is in composite explosives, such as Composition A, B, and C explosives. RDX is available commercially under the name cyclonite.

d. *Trinitrotoluene*. TNT is the most common military explosive. It may be in composite form, such as a booster, a bursting, or a demolition charge, or in a noncomposite form. Since TNT is a standard explosive, it is used to rate other military explosives.

e. *Tetryl*. Tetryl is an effective booster charge in its noncomposite form and a bursting or a demolition charge in composite forms. Tetryl is more sensitive and powerful than TNT. However, RDX- and PETN-based explosives, which have increased power and shattering effects, are replacing tetryl and composite explosives containing tetryl.

f. *Nitroglycerin*. Nitroglycerin is one of the most powerful high explosives. Its explosive potential is comparable to RDX and PETN. Nitroglycerin is the explosive base for commercial dynamites. Nitroglycerine is highly sensitive and extremely temperature-sensitive. Military explosives do not use nitroglycerin because of its sensitivity. Do not use commercial dynamites in combat areas.

g. *Black Powder*. Black powder is the oldest-known explosive and propellant. It is a composite of potassium or sodium nitrate, charcoal, and sulfur. Time fuses, some igniters, and some detonators contain black powder.

h. *Amatol*. Amatol is a mixture of ammonium nitrate and TNT. It is a substitute for TNT in bursting charges. Some older bangalore torpedoes use 80-20 amatol (80 percent ammonium nitrate and 20 percent TNT). Because amatol contains ammonium nitrate, it is a hygroscopic compound. Keep any explosives containing amatol in airtight containers. If properly packaged, amatol remains viable for long periods of time, with no change in sensitivity, power, or stability.

i. *Composition A3*. Composition A3 is a composite explosive containing 91 percent RDX and 9 percent wax. The purpose of the wax is to coat, desensitize, and bind the RDX particles. Composition A3 is the booster charge in some newer shaped charges and bangalore torpedoes. High-explosive plastic (HEP) projectiles may also contain Composition A3 as a main charge.

j. *Composition B*. Composition B is a composite explosive containing approximately 60 percent RDX, 39 percent TNT, and 1 percent wax. It is more sensitive than TNT. Because of its shattering power and high rate of detonation, Composition B is the main charge in shaped charges.

k. *Composition B4*. Composition B4 contains 60 percent RDX, 39.5 percent TNT, and 0.5 percent calcium silicate. Composition B4 is the main charge in newer models of bangalore torpedoes and shaped charges.

l. *Composition C4 (C4)*. C4 is a composite explosive containing 91 percent RDX and 9 percent nonexplosive plasticizers. Bursting charges are composed of C4. C4 is effective in temperatures between -70 to +170 degrees Fahrenheit; however, C4 loses its plasticity in the colder temperatures.

m. *Tetrytol*. Tetrytol is a composite explosive containing 75 percent tetryl and 25 percent TNT. It is the explosive component in demolition charges. Booster charges require different mixtures of tetryl and TNT. Tetrytol is more powerful than its individual components, is better at shattering than TNT, and is less sensitive than tetryl.

n. *Pentolite*. Pentolite is a mixture of PETN and TNT. Because of its high power and detonating rate, a mixture of 50-50 pentolite (50 percent PETN and 50 percent TNT) makes an effective booster charge in certain models of shaped charges.

o. *Dynamites.*

(1) **Standard Dynamite.** Most dynamites, with the notable exception of military dynamite, contain nitroglycerin plus varying combinations of absorbents, oxidizers, antacids, and freezing-point depressants. Dynamites vary greatly in strength and sensitivity depending on, among other factors, the percentage of nitroglycerin they contain. Dynamites are for general blasting and demolitions, including land clearing, cratering and ditching, and quarrying.

(2) **Military Dynamite.** Military dynamite is a composite explosive that contains 75 percent RDX, 15 percent TNT, and 10 percent desensitizers and plasticizers. Military dynamite is not as powerful as commercial dynamite. Military dynamite's equivalent strength is 60 percent of commercial dynamite's. Because military dynamite contains no nitroglycerin, it is more stable and safer to store and handle than commercial dynamite.

1-4. Foreign Explosives.

a. *Composition.* Foreign countries use a variety of explosives, including TNT, picric acid, amatol, and guncotton. Picric acid is similar to TNT, but it also corrodes metals and thus forms extremely sensitive compounds.

WARNING

**Do not use picric acid in rusted or corroded metal containers.
Do not handle picric acid. Notify explosive ordnance disposal (EOD) personnel
for disposition.**

b. *Use.* You may use the explosives of allied nations and those captured from the enemy to supplement standard supplies. Only expert demolitionists should use such explosives and then only according to instructions and directives of theater commanders. Captured bombs, propellants, and other devices may be used with US military explosives for larger demolition projects, such as pier, bridge, tunnel, and airfield destruction. Most foreign explosive blocks have cap wells large enough to receive US military blasting caps. Since foreign explosives may differ from US explosives in sensitivity and force, test shots should be made to determine their adequacy before extensive use or mixing with US-type explosives.

Section II. Service Demolition Charges

1-5. Block Demolition Charges. Block demolition charges are prepackaged, high-explosive charges for general demolition operations, such as cutting, breaching, and cratering. They are composed of the high-explosive TNT, tetrytol, Composition-C series, and ammonium nitrate. Block charges are rectangular in form except for the 40-pound, ammonium-nitrate block demolition charge, military dynamite, and the 1/4-pound-TNT block demolition charge, which are all cylindrical in form. The various block charges available are described in the text that follows, as well as Table 1-2. See TM 43-0001-38 for detailed information about demolition charges and accessories.

Table 1-2. Characteristics of block demolition charges

| Explosive | Unit (Pounds) | Size (Inches) | Detonation Velocity | | RE Factor | Packaging/Weight ² |
|-------------------------|---------------|---------------|---------------------|--------|-----------|--|
| | | | M/Sec | Ft/Sec | | |

¹The volume of M112 is 20 cubic inches. The volume of one sheet of M118 is 9 cubic inches.
²Packaging weights include packaging material and weight of container.

1-6. TNT Block Demolition Charge.

a. *Characteristics.* TNT block demolitions, shown in Figure 1-1, are available in three sizes (Table 1-2). The ¼-pound block is issued in a cylindrical, waterproof, olive-drab cardboard container. The ½-pound and 1-pound blocks are available in similar rectangular containers. All of the three charges have metal ends with a threaded cap well in one end.

Figure 1-1. TNT block demolition charges

b. *Use.* TNT block demolition charges are effective for all types of demolition work. However, the ¼-pound charge is primarily for training purposes.

c. *Advantages.* TNT demolition charges have a high detonating velocity. They are stable, relatively insensitive to shock or friction, and water resistant. They also are conveniently sized, shaped, and packaged.

d. *Limitations.* TNT block demolition charges cannot be molded and are difficult to use on irregularly shaped targets. TNT is not recommended for use in closed spaces because one of the products of explosion is poisonous gases.

1-7. M112 Block Demolition Charge.

a. *Characteristics.* The M112 block demolition charge consists of 1.25 pounds of C4 packed in an olive-drab, Mylar-film container with a pressure-sensitive adhesive tape on one surface (Figure 1-2). The tape is protected by a peelable paper cover. Table 1-2 (page 1-5) lists additional characteristics of the M112 block.

Figure 1-2. M112 block demolition charge

b. *Use.* The M112 block demolition charge is used primarily for cutting and breaching. Because of its high cutting effect and its ability to be cut and shaped, the M112 charge is ideally suited for cutting irregularly shaped targets such as steel. The adhesive backing allows you to place the charge on any relatively flat, clean, dry surface with a

temperature that is above the freezing point. The M112 charge is the primary block demolition charge presently in use.

WARNING

Composition C4 explosive is poisonous and dangerous if chewed or ingested; its detonation or burning produces poisonous fumes. Cut all plastic explosives with a sharp steel knife on a nonsparking surface.
Do not use shears.

c. *Advantages.* You can cut to shape the M112 block demolition charge to fit irregularly shaped targets. The color of the wrapper helps camouflage the charge. Molding the charge will decrease its cutting effect.

d. *Limitations.* The adhesive tape will not adhere to wet, dirty, rusty, or frozen surfaces.

1-8. M118 Block Demolition Charge.

a. *Characteristics.* The M118 block demolition charge, or *sheet explosive*, is a block of four ½-pound sheets of flexible explosive packed in a plastic envelope (Figure 1-3). Twenty M118 charges and a package of 80 M8 blasting-cap holders are packed in a wooden box. Each sheet of the explosive has a pressure-sensitive adhesive tape attached to one surface. Table 1-2 (page 1-5) lists additional characteristics for the M118 charge.

Figure 1-3. M118 block demolition charge

b. *Use.* The M118 charges are designed for cutting, especially against steel targets. The sheets of explosive are easily and quickly applied to irregular and curved surfaces and are easily cut to any desired dimension. The M118 charge is effective as a small breaching charge but, because of its high cost, it is not suitable as a bulk explosive charge.

c. *Advantages.* The flexibility and adhesive backing of the sheets allow application to a large variety of targets. You can cut the ½-pound sheets to any desired dimension and apply them in layers to achieve the desired thickness. The M118 charge is not affected by water, making it acceptable for underwater demolitions.

d. *Limitations.* The adhesive tape will not adhere to wet, dirty, rusty, or frozen surfaces.

1-9. M186 Roll Demolition Charge.

a. *Characteristics.* The M186 roll demolition charge, shown in Figure 1-4, is identical to the M118 block demolition charge except that the sheet explosive is in roll form on a 50-foot, plastic spool. Each foot of the roll provides approximately a half pound of explosive. Included with each roll are 15 M8 blasting cap holders and a canvas bag with carrying strap. Table 1-2 (page 1-5) lists additional characteristics for the M186 charge.

Figure 1-4. M186 roll demolition charge

b. *Use.* Use the M186 roll demolition charge in the same manner as the M118 block demolition charge. The M186 charge is adaptable for demolishing targets that require the use of flexible explosives in lengths longer than 12 inches.

c. *Advantages.* The M186 roll demolition charge has all the advantages of the M118 block demolition charge. You can cut the M186 charge to the exact lengths desired.

d. *Limitations.* The adhesive backing will not adhere to wet, dirty, rusty, or frozen surfaces.

1-10. Forty-Pound, Ammonium-Nitrate Block Demolition Charge

a. *Characteristics.* Figure 1-5 (page 1-8) shows the 40-pound, ammonium-nitrate block demolition charge or cratering charge. It is a watertight, cylindrical metal container with approximately 30 pounds of an ammonium-nitrate-based explosive and 10 pounds of TNT-based explosive booster in the center, next to the priming tunnels. The two priming tunnels are located to the outside of the container, midway between the ends. One tunnel serves as a cap well for priming the charge with an M6 electric or M7 nonelectric military blasting cap. The other tunnel serves as a priming path, with the detonating cord passing through the tunnel and knotted at the end. There is a cleat between the tunnels to secure the time blasting fuse, electrical firing wire, or detonating cord. There is a metal ring on the top of the container for lowering the charge into its hole. Table 1-2 (page 1-5) lists additional characteristics for the 40-pound, ammonium-nitrate block demolition charge.

Figure 1-5. Forty-pound, ammonium-nitrate cratering charge

b. *Use.* This charge is suitable for cratering and ditching operations. Its primary use is as a cratering charge, but it also is effective for destroying buildings, fortifications, and bridge abutments.

c. *Advantages.* The size and shape of this charge make it ideal for cratering operations. It is inexpensive to produce compared to other explosives.

d. *Limitations.* Ammonium nitrate is hygroscopic. When wet, it will not detonate. To ensure detonation, use metal containers showing no evidence of water damage. Detonate all charges placed in wet or damp boreholes as soon as possible.

1-11. M1 Military Dynamite.

a. *Characteristics.* M1 military dynamite is an RDX-based composite explosive containing no nitroglycerin (Figure 1-6). M1 dynamite is packaged in 1/2-pound, paraffin-coated, cylindrical paper cartridges, which have a nominal diameter of 1.25 inches and a nominal length of 8 inches. Table 1-2 (page 1-5) lists additional characteristics for M1 military dynamite.

Figure 1-6. M1 military dynamite

b. *Use.* M1 dynamite's primary uses are military construction, quarrying, ditching, and service demolition work. It is suitable for underwater demolitions.

c. *Advantages.* M1 dynamite will not freeze or perspire in storage. The M1 dynamite's composition is not hygroscopic. Shipping containers do not require turning during storage. M1 dynamite is safer to store, handle, and transport than 60-percent commercial dynamite. Unless essential, do not use civilian dynamite in combat areas.

d. *Limitations.* M1 dynamite is reliable underwater only for 24 hours. Because of its low sensitivity, pack sticks of military dynamite well to ensure complete detonation of the charge. M1 dynamite is not efficient as a cutting or breaching charge.

Section III. Special Demolition Charges and Assemblies

1-12. Shaped Demolition Charge. The shaped demolition charge used in military operations is a cylindrical block of high explosive. It has a conical cavity in one end that directs the cone-lining material into a narrow jet to penetrate materials (Figure 1-7). This charge is not effective underwater, since any water in the conical cavity will prevent the high-velocity jet from forming. To obtain maximum effectiveness, place the cavity at the specified standoff distance from the target, and detonate the charge from the exact rear center, using only the priming well provided. Never dual prime a shaped charge.

Figure 1-7. Shaped charges

a. Characteristics.

(1) Fifteen-Pound, M2A4 Shaped Demolition Charge. The M2A4 charge contains a 0.11-pound (50 gram) booster of Composition A3 and a 11.5-pound main charge of Composition B. It is packaged three charges per wooden box (total weight is 65 pounds). This charge has a moisture-resisting, molded-fiber container. A cylindrical fiber base slips onto the end of the charge to provide a 6-inch standoff distance. The cavity liner is a cone of glass. The charge is $14\frac{15}{16}$ inches high and 7 inches in diameter, including the standoff.

(2) Forty-Pound, M3A1 Shaped Demolition Charge. The M3A1 charge contains a 0.11-pound (50 gram) booster of Composition A3 and a 29.5-pound main charge of Composition B. It is packaged one charge per box (total weight is 65 pounds). The charge is in a metal container. The cone liner also is made of metal. A metal tripod provides a 15-inch standoff distance. The charge is $15\frac{1}{2}$ inches high and 9 inches in diameter, not including standoff.

b. *Use.* A shaped demolition charge's primary use is for boring holes in earth, metal, masonry, concrete, and paved and unpaved roads. Its effectiveness depends largely on its shape, composition, and placement. Table 1-3, lists the penetrating capabilities of various materials and the proper standoff distances for these charges.

Table 1-3. Characteristics of boreholes made by shaped charges

| Material | Specifications | M2A4 Shaped Charge (15-Pound)* | M3A1 Shaped Charge (40-Pound)** |
|--|--|---|--|
| Armor plate | Penetration Average hole diameter | 12.00 in 1.50 in | At least 20.00 in 2.50 in |
| Reinforced concrete | Maximum wall thickness Penetration depth in thick walls Average hole diameter Minimum hole diameter | 36.00 in 30.00 in 2.75 in 2.00 in | 60.00 in 60.00 in 3.50 in 2.00 in |
| Concrete pavement (10-inch with 21-inch rock base course) | Optimum standoff Minimum penetration depth Maximum penetration depth Minimum hole diameter | 42.00 in 44.00 in 91.00 in 1.75 in | 60.00 in 71.00 in 109.00 in 6.75 in |
| Concrete pavement (3-inch with 24-inch rock base course) | Optimum standoff Minimum penetration depth Maximum penetration depth Minimum hole diameter | 42.00 in 38.00 in 90.00 in 3.75 in | — — — — |
| Permafrost | Hole depth (30-inch standoff) Hole depth (42-inch standoff) Hole depth (50-inch standoff) Hole diameter (42-inch standoff) Hole diameter (50-inch standoff) Hole diameter (normal standoff) | 72.00 in 60.00 in — 1.50 to 6.00 in — 4.00 to 30.00 in | — — 72.00 in — 5.00 to 8.00 in 7.00 to 30.00 in |
| Ice | Hole depth (42-inch standoff) Hole diameter (42-inch standoff) | 7.00 ft 3.50 in | 12.00 ft 6.00 in |

| Graveled roads | Hole depth (30-inch standoff) Hole depth (48-inch standoff) Hole diameter (30-inch standoff) Hole diameter (48-inch standoff) | 7.00 ft — 7.00 in — | — 9.00 ft — 7.00 in |
| *A dash in the M2A4 Shaped Charge column indicates that a M3A1 shaped charge is required. | | | |
| **A dash in the M3A1 Shaped Charge column indicates that a M2A4 shaped charge is sufficient. | | | |

c. *Special Precautions.* To achieve the maximum effectiveness of shaped charges—

- Center the charge over the target point.
- Align the axis of the charge with the direction of the desired hole.
- Use the pedestal to obtain the proper standoff distance.

- Suspend the charge at the proper height on pickets or tripods, if the pedestal does not provide the proper standoff distance.
- Remove any obstruction in the cavity liner or between the charge and the target.

1-13. M183 Demolition Charge Assembly.

a. *Characteristics.* The M183 demolition charge assembly or *satchel charge* consists of 16 M112 (C4) demolition blocks and 4 priming assemblies. It has a total explosive weight of 20 pounds. The demolition blocks come in two bags, eight blocks per bag. The two bags come in an M85 canvas carrying case. Two M85 cases come in a wooden box 17½ by 11½ by 12½ inches. Each priming assembly consists of a 5-foot length of detonating cord with an RDX booster crimped to each end and a pair of M1 detonating-cord clips for attaching the priming assembly to a detonating cord ring or line main.

b. *Use.* The M183 assembly is used primarily for breaching obstacles or demolishing structures when large demolition charges are required (Figure 1-8). The M183 charge also is effective against smaller obstacles, such as small dragon's teeth.

Figure 1-8. M183 demolition charge assembly

c. *Detonation.* Detonate the M183 demolition charge assembly with a priming assembly and an electric or a nonelectric blasting cap or by using a detonating-cord ring main attached by detonating cord clips.

1-14. M1A2 Bangalore-Torpedo Demolition Kit.

a. *Characteristics.* Each kit consists of 10 loading assemblies, 10 connecting sleeves, and 1 nose sleeve. The loading assemblies, or torpedoes, are steel tubes 5 feet long and 2½ inches in diameter, grooved, and capped at each end (Figure 1-9, page 1-12). The torpedoes have a 4-inch, Composition A3 booster (½ pound each) at both ends of each 5-foot section. The main explosive charge is 10½ pounds of Composition B4. The kit is packaged in a 60¾- by 13¾- by 49/16-inch wooden box and weighs 198 pounds.

Figure 1-9. M1A2 Bangalore torpedo

b. *Use.* The primary use of the torpedo is clearing paths through wire obstacles and heavy undergrowth. It will clear a 3- to 4-meter-wide path through wire obstacles.

WARNING

The Bangalore torpedo may detonate a live mine when being placed. To prevent detonation of the torpedo during placement, attach the nose sleeve to a fabricated dummy section (approximately the same dimensions as a single Bangalore section) and place the dummy section onto the front end of the torpedo.

c. *Assembly.* All sections of the torpedo have threaded cap wells at each end. To assemble two or more sections, press a nose sleeve onto one end of one tube, and then connect successive tubes, using the connecting sleeves provided until you have the desired length. The connecting sleeves make rigid joints. The nose sleeve allows the user to push the torpedo through entanglements and across the ground.

d. *Detonation.* The recommended method to detonate the torpedo is to prime the torpedo with eight wraps of detonating cord and attach two initiation systems for detonation. Another method for priming the Bangalore torpedo is by inserting an electric or a nonelectric blasting cap directly into the cap well. Do not move the torpedo after it has been prepared for detonation. You may wrap the end with detonating cord prior to placing it, but do not attach the blasting caps until the torpedo is in place.

1-15. M180 Demolition Kit (Cratering).

a. *Characteristics.* This kit consists of an M2A4 shaped charge, a modified M57 electrical firing device, a warhead, a rocket motor, a tripod, and a demolition circuit (Figure 1-10). The shaped charge, firing device, and warhead are permanently attached to the launch leg of the tripod. The rocket motor and the demolition circuit (packed in a wooden subpack) are shipped separately. The

kit weighs approximately 165 pounds (74.25 kilograms). TM 9-1375-213-12-1 provides the assembly procedures, operational description, and maintenance instructions for the M180 kit.

Figure 1-10. M180 demolition kit assembly

b. *Use.* The M180 is designed to produce a large crater in compacted soil or road surfaces, but not in reinforced concrete, arctic tundra, bedrock, or sandy soil. The charge produces a crater in two stages. The shaped charge blows a pilot hole in the surface. Then, the rocket-propelled warhead enters the hole and detonates, enlarging the pilot hole. Up to five kits can be set up close together and fired simultaneously to produce an exceptionally large crater. Up to 15 kits can be widely spaced and fired simultaneously for airfield pocketing.

WARNING

Regardless of the number of kits used, the minimum safe distances for the M180 cratering kit are 1,200 meters for unprotected personnel and 150 meters for personnel under overhead cover.

c. *Detonation.* When firing the M180, use the M34 50-cap blasting machine.

Section IV. Demolition Accessories

1-16. Time Blasting Fuse. The time blasting fuse transmits a delayed spit of flame to a nonelectric blasting cap. The delay allows the soldier to initiate a charge and get to a safe distance before the explosion. There are two types of fuses: the M700 time fuse and safety fuse. Although safety fuse is not often employed, it is still available.

Figure 1-11. M700 time fuse

temperatures. The M700 time fuse is packaged in 50-foot coils, two coils per package, five packages per sealed container, and eight containers (4,000 feet) per wooden box (30 $\frac{1}{8}$ by 15 $\frac{1}{8}$ by 14 $\frac{7}{8}$ inches). The total package weighs 94 pounds.

Figure 1-12. Safety fuse

significantly faster underwater, test it underwater before preparing an underwater charge. Safety fuse is packaged in 50-foot coils, two coils per package, and 30 packages (3,000 feet) per wooden box (24 $\frac{3}{4}$ by 15 $\frac{3}{4}$ by 12 $\frac{1}{2}$ inches). The total package weighs 93.6 pounds.

1-17. Detonating Cord.

a. *Characteristics.* The American, British, Canadian, and Australian (ABCA) Standardization Program recognizes this Type 1 detonating cord as the standard detonating cord. Detonating cord (Figure 1-13) consists of a core of high explosive (6.4 pounds of PETN per 1,000 feet) wrapped in a reinforced and waterproof olive-drab plastic coating. This detonating cord is approximately 0.2 inches in diameter, weighs approximately 18 pounds per 1,000 feet, and has a breaking strength of 175 pounds. Detonating cord is functional in the same temperature range as plastic explosive, although the cover becomes brittle at lower temperatures. Moisture can penetrate the explosive filling to a maximum distance of 6 inches from any cut or break in the coating. Water-soaked detonating cord will detonate if there is a dry end to allow initiation. For this reason, cut off and discard the first 6 inches of any new or used detonating cord that nonelectric blasting caps are crimped to. Also, leave a 6-inch overhang when making connections or when priming charges.

a. *M700 Time Fuse.* The M700 fuse is a dark green cord, 0.2 inches in diameter, with a plastic cover (Figure 1-11). The M700 burns at an approximate rate of 40 seconds per foot. However, test the burning rate as outlined in Chapter 2 (paragraph 2-1b(1), page 2-2). Depending on the date of manufacture, the cover may be smooth or have single yellow bands around the outside at 12- or 18-inch intervals and double yellow bands at 60- or 90-inch intervals. These bands accommodate hasty measuring. The outside covering becomes brittle and cracks easily in arctic

b. *Safety Fuse.* Safety fuse consists of black powder tightly wrapped with several layers of fiber and waterproofing material. The outside covering becomes brittle and cracks easily in arctic temperatures. The burning rate may vary for the same or different rolls (30 to 45 seconds per foot) under different atmospheric and climatic conditions. This fuse may be any color, but orange is the most common (Figure 1-12). Test each roll in the area where the charge will be placed (paragraph 2-1b(1), page 2-2). Since safety fuse burns

Figure 1-13. Detonating cord

b. *Use.* Use detonating cord to prime and detonate other explosive charges. When the detonating cord's explosive core is initiated by a blasting cap, the core will transmit the detonation wave to an unlimited number of explosive charges. Chapter 2 explains the use of detonating cord for these purposes.

c. *Precautions.* Seal the ends of detonating cord with a waterproof sealant when used to fire underwater charges or when charges are left in place several hours before firing. If left for no longer than 24 hours, a 6-inch overlap will protect the remainder of a line from moisture. Avoid kinks or sharp bends in priming, as they may interrupt or change the direction of detonation and cause misfires. Avoid unintended cross-overs of the detonating cord where no explosive connection is intended. To avoid internal cracking do not step on the detonating cord.

1-18. Blasting Caps. Blasting caps are for detonating high explosives. There are two types of blasting caps: electric and nonelectric. They are designed for insertion into cap wells and are also the detonating element in certain firing systems and devices. Blasting caps are rated in power, according to the size of their main charge. Commercial blasting caps are normally Number 6 or 8 and are for detonating the more sensitive explosives, such as commercial dynamite and tetryl. Special military blasting caps (M6 electric and M7 nonelectric) ensure positive detonation of the generally less sensitive military explosives. Their main charge is approximately double that of commercial Number 8 blasting caps. Never carry blasting caps loose or in uniform pockets where they are subject to shock. Separate blasting caps properly. Never store blasting caps with other explosives. Do not carry blasting caps and other explosives in the same truck except in an emergency (paragraph 6-11, page 6-10).

WARNING

Handle military and commercial blasting caps carefully, as both are extremely sensitive and may explode if handled improperly.

Do not tamper with blasting caps. Protect them from shock and extreme heat.

a. *Electric Blasting Caps.* Use electric blasting caps when a source of electricity, such as a blasting machine or a battery, is available. Both military and commercial caps may be used. Military caps (Figure 1-14, page 1-6) operate instantaneously. Commercial caps may operate instantaneously or have a delay feature. The delay time of commercial caps for military applications ranges from 1 to 1.53 seconds. Electric caps have lead wires of various lengths. The most common lead length is 12 feet. Electric caps require 1.5 amperes of power to initiate. The standard-issue cap

is the M6 special electric blasting cap. TM 43-0001-38 gives additional information on blasting caps.

WARNING

Do not remove the short-circuiting shunt until ready to test the cap.
Doing this prevents accidental initiation by static electricity.
If the cap has no shunt, twist the lead's bare ends together with at least three 180-degree turns to provide a shunting action.

Figure 1-14. Electric blasting caps

Figure 1-15. Nonelectric blasting cap

b. *Nonelectric Blasting Caps.* Initiate these caps with time-blasting fuse, a firing device, or detonating cord (Figure 1-15). Avoid using nonelectric blasting caps to prime underwater charges because the caps are hard to waterproof. If necessary, waterproof nonelectric blasting caps with a sealing compound. The M7 special nonelectric blasting cap is the standard issue. The open end of the M7 special nonelectric blasting cap is flared to allow easy insertion of the time fuse. TM 43-0001-38 gives additional information on blasting caps.

1-19. M1A4 Priming Adapter. The M1A4 priming adapter is a plastic, hexagonal-shaped device, threaded to fit threaded cap wells. The

shoulder inside the threaded end will allow time blasting fuse and detonating cord to pass, but the shoulder is too small to pass a military blasting cap. To accommodate electric blasting caps, the adapter has a lengthwise slot that permits blasting cap lead wires to be quickly and easily installed in the adapter (Figure 1-16).

Draft Chemical Composition of Munitions Report

APPENDIX B. TELEPHONE CONVERSATIONS AND INTERVIEW LOGS

Telephone Call Summary Sheet

To: Tom Walch

Of: US Army, Picatinny Arsenal

Phone: 201/724-6463

By: Mark Gerath, Ogden Environmental

Re: Change in Munitions Quality Over the Last 40 to 50 Years

Date: July 1, 1997

Mr. Walch works in the development of mortar rounds. He indicated that little change would be expected in the composition of high explosives and casing materials of either mortars or gun munitions since the World War II era. For example, Composition B has been in general employment for approximately 60 years. Similarly, the chemical composition of hand grenades would also be expected to be relatively stable. He said he understands that some state National Guard units still train with hand grenades of World War II vintage. Finally, primer materials would also be expected to be maintained through the years of major activity at MMR.

He believes that differences are likely in the propellants used for munitions. Some of these differences will depend on manufacturer which may change through the years. Other changes have occurred as the Army has required greater range in its munitions and therefore greater pressures are necessary within the weapon barrel.

Some tracer, light, and smoke generating materials are also likely to have changed. While red and white phosphorous has been used consistently through the years other materials are also being phased in and out through time. He noted that the rate of use of these materials is likely to be relatively low.

Telephone Call Summary Sheet

To: Lillianna Suarez

Of: US Army, Picatinny Arsenal

Phone: 201/724-6089

By: Mark Gerath, Ogden Environmental

Re: Change in Munitions Quality Over the Last 40 to 50 Years

Date: June 25, 1997

Ms. Suarez is a project engineer specializing in environmental applications. I called to inquire about general levels of change in munitions since 1940. In particular, are current munitions likely to be similar in chemical quality to those used previously at MMR. Ms. Suarez works with small arms munitions; she said a colleague of hers (Tom Walch 201/724-6463) might know more about mortars and howitzer munitions. She believed that despite changes in the caliber thorough the years, the composition of the projectiles is very likely to be pretty constant. She asked that I confirm this with Wade Bunting (201/724-6040). The exception to this is more recent munitions that are designed to have better penetration capacity. She said it was unlikely that such munitions would be used in training applications because of their high cost.

Telephone Call Summary Sheet

To: Wade Bunting

Of: US Army, Picatinny Arsenal

Phone: 201/724-6040

By: Mark Gerath, Ogden Environmental

Re: Change in Munitions Quality Over the Last 40 to 50 Years

Date: June 25, 1997

Ms. Bunting confirmed that standard issue munitions, as would likely be used in training ranges, would have changed little in composition since the 1940s. This applies to both regular projectiles as well as tracer bullets. As an example, 30 caliber bullets used in the 1940s and 7.62 mm bullets used in the 1950s both weigh 150 grains and have a core of 98% lead and 2% antimony. The size of the cartridge varies between the two bullets. The 5.56 mm bullet adopted in the 1960s weighs either 55 or 62 grains but has the same composition.

He was less sure about the composition of the propellant used throughout this period. He said he would investigate this issue and get back to me. He will also look into changes in speciality rounds. He will find a point of contact for me to discuss changes in artillery and mortar rounds.

Draft Chemical Composition of Munitions Report

APPENDIX C. MIDAS DATABASE DOWNLOAD

The codes contained within the MIDAS database tend to be rather ambiguous (MIDAS Technical Assistance Coordinators, Lisa Anderson and Jim Yenny). A specific code can mean different things in different contexts. In some cases, even within a specific context, a code can have multiple meanings. Thus, the database is designed for relatively sophisticated users who will be able to impart some expertise in the interpretation of the coded information. The following is brief description of the fields contained within MIDAS:

- DODAC designations are used exclusively for ordering munitions by the Army - the alphabetic assignments in the code have no particular meaning with regard to composition but are related to the class of munition (e.g., small arms, grenades, etc.)
- The “nomenclature” field consists of three portions that define: (1) munition type (e.g., projectile, cartridge, case); munition form, size, and shape (e.g., 556 mm ball); and the model number (e.g., M193).
- TGCS (type/grade/class/style) are distinguishing characteristics of the particular munition. This field can have up to four separate subfields separated by slashes (i.e., /). This field was recently adopted by MIDAS and many of the field contents are difficult to interpret without detailed knowledge of the munition.
- Factor and factored weight refer to the number of, and total weight of, component(s) of a given munition. For example, a lead bullet may have one slug (Factor = 1) weighing 0.015 lb yielding a factored weight of 0.015 lb. On the other hand, a cluster bomb may have 100 of lead clusters (Factor = 100) each weighing 0.015 lb for a total weight of 1.5 lb (Factored weight = 1.5 lb).

| DODAC | Type | Quantity | Search | Printout | Page(s) |

MIDAS: Detailed Structure B642

| | |
|------------------|------------------|
| Nomenclature: | CTG 60MM HE M720 |
| NSN: | 1310010227680 |
| DODIC: | B642 |
| Drawing #: | 9275526 |
| Family: | HC |
| Reported weight: | 3.7500 LB |
| Specification: | MIL-C-48368 |
| Remarks: | |

| # | Type | Drawing# | Nomenclature | Weight |
|-----|------------|-----------|---|----------|
| *1 | *Munition | *9275526 | CTG 60MM HE M720 | *3.75 LB |
| *2 | *Part | *11751196 | --FIN (AL ALLOY) | *0.00 |
| *3 | *Bulk item | * | ----PETTMAN CEMENT | |
| *4 | *Bulk item | * | ----SHELLAC (ALT) | |
| *5 | *Bulk item | * | ----GRAPHITE (ALT) | |
| *6 | *Part | *11751196 | --FIN (AL ALLOY) (ALT) | *0.00 |
| *7 | *Bulk item | * | ----PETTMAN CEMENT | |
| *8 | *Bulk item | * | ----SHELLAC (ALT) | |
| *9 | *Bulk item | * | ----GRAPHITE (ALT) | |
| *10 | *Part | *11751152 | --RING OBTURATING (PLASTIC) | *0.00 |
| *11 | *Part | *9310754 | --LABEL WARNING (TAPE PRESSURE SENSITIVE) | *0.00 |
| *12 | *Bulk item | * | ----INK PRINTERS | |
| *13 | *Component | *9280553 | --CTG IGN LOADING ASSY M702 | *0.00 |
| *14 | *Part | *9321224 | ----PLUG FIRING (AL ALLOY) | *0.00 |
| *15 | *Bulk item | * | -----CHROMATE COATING | |
| *16 | *Bulk item | * | -----LACQUER CELL NITRATE | |
| *17 | *Part | *9321224 | ----PLUG FIRING (AL ALLOY) (ALT) | *0.00 |
| *18 | *Bulk item | * | -----CHROMATE COATING | |
| *19 | *Bulk item | * | -----LACQUER CELL NITRATE | |
| *20 | *Part | *9321225 | ----SUPPORT (AL ALLOY) | *0.00 |
| *21 | *Bulk item | * | -----LACQUER CELL NITRATE | |
| *22 | *Part | *9321225 | ----SUPPORT (AL ALLOY) (ALT) | *0.00 |
| *23 | *Bulk item | * | -----LACQUER CELL NITRATE | |
| *24 | *Part | *9285481 | ----HEAD (AL ALLOY) | *0.00 |
| *25 | *Bulk item | * | -----CHROMATE COATING | |
| *26 | *Bulk item | * | -----ADHESIVE RTV (9233455) | |
| *27 | *Part | *9285481 | ----HEAD (AL ALLOY) (ALT) | *0.00 |
| *28 | *Bulk item | * | -----CHROMATE COATING | |
| *29 | *Bulk item | * | -----ADHESIVE RTV (9233455) | |
| *30 | *Part | *9280530 | ----TUBE (CTG PAPER) | *0.00 |

| | | | | |
|-----|------------|------------|--|-----------|
| *31 | *Bulk item | * | -----ADHESIVE | |
| *32 | *Part | *9280532 | -----CAP (AL ALLOY) | *0.00 |
| *33 | *Bulk item | * | -----CHROMATE COATING | |
| *34 | *Bulk item | * | -----ADHESIVE RTV (9233455) | |
| *35 | *Part | *9280532 | -----CAP (AL ALLOY) (ALT) | *0.00 |
| *36 | *Bulk item | * | -----CHROMATE COATING | |
| *37 | *Bulk item | * | -----ADHESIVE RTV (9233455) | |
| *38 | *Part | * | -----PROP M9 (PROP M9) | *52.00 GR |
| *39 | *Compound | * | -----NC (57.75%) | |
| *40 | *Compound | * | -----NITROGLYCERIN (40.00%) | |
| *41 | *Compound | * | -----K NITRATE (1.50%) | |
| *42 | *Compound | * | -----DIPHENYLAMINE (0.75%) | |
| *43 | *Component | *9280529 | -----FLASH TUBE LOADING ASSY | *0.00 |
| *44 | *Part | *12561290 | -----PELLET (BLACK PWDR CL 7) | *3.12 GR |
| *45 | *Compound | * | -----K NITRATE (74.00%) | |
| *46 | *Compound | * | -----S (10.40%) | |
| *47 | *Compound | * | -----CHARCOAL (15.60%) | |
| *48 | *Component | *12561286 | -----FLASH TUBE ASSY | *0.00 |
| *49 | *Part | *9280533 | -----TUBE FLASH (AL ALLOY) | *0.00 |
| *50 | *Bulk item | * | ADHESIVE CELL NITRATE | |
| *51 | Part | 12561289 | TUBING HEAT SHRINKABLE (IRRADIATED POLYOLEFIN) | *0.00 |
| *52 | *Part | MS9390-304 | -----PIN (STEEL) | *1.28 GR |
| *53 | *Part | *9297909 | -----PIN (AL ALLOY) (ALT) | *0.00 |
| *54 | *Component | *8840536 | -----PRIMER PERC M35 ASSY | *0.00 |
| *55 | *Part | *8840537 | -----CUP (CU ALLOY) | *0.00 |
| *56 | *Bulk item | * | -----LACQUER CELL NITRATE | |
| *57 | *Part | *8840534 | -----COVER (PAPER SEALING) | *0.00 |
| *58 | *Bulk item | * | -----ETHYL ALCOHOL | |
| *59 | *Bulk item | * | -----ACETONE (ALT) | |
| *60 | *Part | *8840535 | -----ANVIL (CU ALLOY) | *0.00 |
| *61 | *Part | * | -----PEP (PRIMER MIX #70) | *0.37 GR |
| *62 | *Compound | * | -----PB THIOCYANATE (25.00%) | |
| *63 | *Compound | * | -----K CHLORATE (53.00%) | |
| *64 | *Compound | * | -----SB SULFIDE (17.00%) | |
| *65 | *Compound | * | -----TNT (5.00%) | |
| *66 | *Part | * | -----PEP (PRIMER MIX #70 (G/G)) (ALT) | *0.48 GR |
| *67 | *Compound | * | -----PB THIOCYANATE (22.50%) | |
| *68 | *Compound | * | -----K CHLORATE (50.50%) | |
| *69 | *Compound | * | -----SB SULFIDE (14.50%) | |
| *70 | *Compound | * | -----TNT (2.50%) | |

| | | | | |
|------|------------|------------|---|------------|
| *71 | *Compound | * | -----GROUND GLASS (10.00%) | |

USADACS - MIDAS DETAILED STRUCTURE FOR A MUNITION (LESS BULK ITEMS)

Nomenclature: CTG 81MM HE M374A3 W/FUZE PD M567

NSN: 1315005637067

DODIC: C256

Reported Weight: 9.5000 LB

| DRAWING # | NOMENCLATURE | TYPE | SPECIFICATION | TGCS | REPORTED WEIGHT | UNIT | FACTOR | FACTORED WEIGHT (LB) |

MIDAS: Detailed Structure K145

| | |
|-------------------------|--|
| Nomenclature: | MINE APERS M18A1 W/ACCESSORIES |
| NSN: | 1345009263950 |
| DODIC: | K145 |
| Drawing #: | 8835166 |
| Family: | HZ |
| Reported weight: | 0.0000 |
| Specification: | MIL-M-45423 |
| Remarks: | This NSN packed w/o Elect test set M40 or firing device M57. |

MIDAS: Detailed Structure L311

| | |
|-------------------------|--------------------------------------|
| Nomenclature: | SIGNAL ILLUM GRND RED STAR PARA M126 |
| NSN: | 1370006292336 |
| DODIC: | L311 |
| Drawing #: | 8797968 |
| Family: | FP |
| Reported weight: | 1.2000 LB |
| Specification: | |
| Remarks: | |

| # | Type | Drawing# | *Nomenclature | Weight |
|-----|------------|----------|--------------------------------------|-----------|
| *1 | *Munition | *8797968 | SIGNAL ILLUM GRND RED STAR PARA M126 | *1.20 LB |
| *2 | *Component | *8797958 | -- WASHER DISC ASSY | *0.00 |
| *3 | *Part | *8797959 | ----DISC LOWER (PAPER ONIONSKIN) | *0.00 |
| *4 | *Bulk item | * | -----LABEL ADHESIVE | |
| *5 | *Bulk item | * | -----ADHESIVE (ALT) | |
| *6 | *Part | *8797960 | ---- WASHER UPPER (WOOL FELT) | *0.00 |
| *7 | *Bulk item | * | -----LABEL ADHESIVE | |
| *8 | *Bulk item | * | -----ADHESIVE (ALT) | |
| *9 | *Component | *8887530 | -- PROPELLANT ASSY | *0.00 |
| *10 | *Part | *8887529 | ----GRAIN PROP (BLACK PWDR MIX) | *13.00 GM |
| *11 | *Compound | * | -----K NITRATE (67.40%) | |
| *12 | *Compound | * | -----S (9.50%) | |
| *13 | *Compound | * | -----CHARCOAL (14.20%) | |
| *14 | *Compound | * | -----CA CARBONATE (8.90%) | |
| *15 | *Bulk item | * | -----PETTMAN CEMENT | |
| *16 | *Part | *8797945 | ----SHEATH (KRAFT PAPER) | *0.00 |
| *17 | *Bulk item | * | -----PETTMAN CEMENT | |
| *18 | *Bulk item | * | -----STENCIL INK | |
| *19 | *Bulk item | * | -----STENCIL INK (ALT) | |
| *20 | *Component | *8797938 | -- WASHER & DISC ASSY | *0.00 |
| *21 | *Part | *8797939 | ---- WASHER (HARDBOARD) | *0.00 |
| *22 | *Bulk item | * | -----LABEL ADHESIVE | |
| *23 | *Bulk item | * | -----ADHESIVE (ALT) | |
| *24 | *Part | *8797940 | ----DISC (TISSUE PAPER) | *0.00 |
| *25 | *Bulk item | * | -----LABEL ADHESIVE | |
| *26 | *Bulk item | * | -----ADHESIVE (ALT) | |
| *27 | *Part | *8797940 | ----DISC (TISSUE PAPER) (ALT) | *0.00 |
| *28 | *Bulk item | * | -----LABEL ADHESIVE | |
| *29 | *Bulk item | * | -----ADHESIVE (ALT) | |

| | | | | |
|-----|------------|------------|-------------------------------------|-----------|
| *30 | *Component | *8797991 | --PARACHUTE ASSY | *0.00 |
| *31 | *Part | *8797991*1 | ----SHROUD (COTTON TWINE) | *0.00 |
| *32 | *Part | *8797991*2 | ----SUSPENSION CORD (ASBESTOS) | *0.00 |
| *33 | *Part | *8797994 | ----PARACHUTE (SILK CLOTH) | *0.00 |
| *34 | *Bulk item | * | -----TALC | |
| *35 | *Part | *8797994 | ----PARACHUTE (NYLON CLOTH) (ALT) | *0.00 |
| *36 | *Bulk item | * | -----TALC | |
| *37 | *Component | *8797953 | --FIRING CAP & SPRING CLIP ASSY | *0.00 |
| *38 | *Part | *8797955 | ----CAP FIRING (AL ALLOY) | *0.00 |
| *39 | *Part | *8797954 | ----PIN FIRING (STEEL) | *0.00 |
| *40 | *Bulk item | * | -----CD CHROMATE | |
| *41 | *Bulk item | * | -----ZN CHROMATE (ALT) | |
| *42 | *Part | *8839487 | ----RIVET FLAT HEAD (AL ALLOY) | *0.00 |
| *43 | *Part | *8839486 | ----CLIP SPRING (STAINLESS STEEL) | *0.00 |
| *44 | *Component | *8797941 | --PROTECTOR ASSY | *0.00 |
| *45 | *Part | *8797942 | ----BLOCK PROTECTOR (WOOD) | *0.00 |
| *46 | *Bulk item | * | -----ADHESIVE SYNTHETIC RUBBER | |
| *47 | *Bulk item | * | -----ADHESIVE PLIOBOND (ALT) | |
| *48 | *Part | *8797943 | ----PROTECTOR RUBBER (RUBBER) | *0.00 |
| *49 | *Bulk item | * | -----ADHESIVE SYNTHETIC RUBBER | |
| *50 | *Bulk item | * | -----ADHESIVE PLIOBOND (ALT) | |
| *51 | *Component | *8797961 | --SIGNAL BODY & DELAY ASSY | *0.00 |
| *52 | *Part | *8797963 | ----BODY SIGNAL (AL ALLOY) | *0.00 |
| *53 | *Bulk item | * | -----LACQUER CELL NITRATE | |
| *54 | *Bulk item | * | -----STENCIL INK | |
| *55 | *Component | *9251412 | ----DELAY ASSY | *0.00 |
| *56 | *Part | *9251411 | -----HOUSING DELAY (AL ALLOY) | *0.00 |
| *57 | *Part | *9251411 | -----HOUSING DELAY (AL ALLOY) (ALT) | *0.00 |
| *58 | *Part | * | -----PEP (FLASH COMP) | *90.00 MG |
| *59 | *Compound | * | -----ZR (58.00%) | |
| *60 | *Compound | * | -----CR OXIDE (16.00%) | |
| *61 | *Compound | * | -----MO TRIOXIDE (25.00%) | |
| *62 | *Compound | * | -----VINYL ALCOHOL (1.00%) | |
| *63 | *Part | * | -----PEP (IGN COMP MIX) (ALT) | *80.00 MG |
| *64 | *Compound | * | -----B AMORPHOUS PWDR (25.00%) | |
| *65 | *Compound | * | -----K PERCHLORATE (75.00%) | |
| *66 | *Part | * | -----PEP (BLACK PWDR CL 7) (ALT) | 140.00 MG |
| *67 | *Compound | * | -----K NITRATE (74.00%) | |
| *68 | *Compound | * | -----S (10.40%) | |
| *69 | *Compound | * | -----CHARCOAL (15.60%) | |

| | | | | |
|------|------------|------------|--|-----------|
| *70 | *Part | * | -----PEP (DELAY COMP) | 570.00 MG |
| *71 | *Compound | * | -----VINYL ALCOHOL (0.30%) | |
| *72 | *Compound | * | -----K PERCHLORATE (11.40%) | |

HEADQUARTERS, DEPARTMENT OF THE ARMY

JUNE 1981

CARTRIDGE, .410, SHOTGUN, NO. M35

ARD80-0061

Type Classification:

OBS MSR11756003

Use:

Rifle/Shotgun, Caliber .22/.410 Bore, Survival, M6.

Description:

Cartridge case is all aluminum; loaded with smokeless powder and No. 6 copper-coated lead shot.

Purpose:

The cartridge is intended for use, in survival weapons, against small game.

Tabulated Data:

DODAC-----1305-A055
 Weight-----430 grain
 Length-----2.690 inch

CARTRIDGE, 10 GAGE, SHOTGUN, BLANK

Type Classification:

Std - OTCM 36524

Use:

This is an optional use item for reveille and retreat salutes; fired in the 3 inch gun, 75-mm gun, 75-mm howitzer, or 105-mm howitzer.

Description:

Cartridge is similar to standard shotgun cartridges but contains no lead shot. It has a paper cartridge case. The forward closing Disc is marked "BLANK".

Purpose:

The cartridge is designed to produce a noise when initiated. Used as a salute item in large caliber weapons. The blank is inserted either in a prepared cartridge case or breech block of the weapon being used.

CARTRIDGE, 7.62-MM, BALL, M80 (Overhead Fire Application)

Type Classification:

Std - MSR 07798001

Use:

Machine Guns, 7.62-MM, M60, M219 and M240.

Description:

BALL Cartridge. This cartridge is identified by a plain bullet tip.

Purpose:

This cartridge is used in machine guns for firing over the heads of troops being trained in field exercises. Stringent production control and screening of ammunition lots ensure the safety of personnel operating immediately below the trajectory of the fired bullets.

Tabulated Data:

CARTRIDGE, 7.62-MM, BLANK, M82

Type Classification:

Std - OTCM 36841

Use:

Machine-Guns, 7.62-MM, M60, M219 and M240;
Rifle, 7.62-MM, M14.

Description:

BLANK Cartridge. The cartridge is identified by its double tapered neck and the absence of a bullet.

Purpose:

The cartridge is used in rifles and machine guns equipped with blank firing attachments to simulate firing in training exercises and for saluting purposes.

CARTRIDGE, CALIBER .38, BALL

ARD80-0088

Type Classification:

OBS - MSR 11756003

Use:

For .38 Caliber weapons.

Description:

BALL Cartridge withunjacketed lead bullet.

Purpose:

This cartridge is for CONUS-guard or security use in caliber .38 weapons.

Tabulated Data:

| | |

ROCKET, HIGH-EXPLOSIVE, 3.5-INCH: AT, M28A2

ARD80-0501

Type Classification:

STD (LCC-B) OTCM 36841 Jul 58

Use:

The M28A2 HEAT rocket is used primarily against armored targets, tanks and secondary targets, such as gun emplacements, pillboxes and personnel. It is capable of penetrating heavy armor at angles of impact greater than 30°. In an antipersonnel role, it has a fragmentation area 10 yd wide and 20 yd deep.

Description:

a. The warhead is cylindrical and tapered. The forward end, called the ~~ogive~~, is thin metal and hollow. The rear end, threaded internally to receive the fuze which is encircled by a safety band. The warhead contains a copper

cone whose apex faces aft and acts to shape the high explosive charge Composition B (Comp B).

b. The base detonating (BD) rocket fuze M404A2 consists of a body which contains the functioning parts; a safety band, a detonator and a booster pellet. The fuze body and safety band are olive drab. The fuze mechanism consists of an activating plunger, a setback spring, a setback sleeve, a firing pin assembly, a detent spring, an ejection pin and an ejection spring. The spring-loaded ejection pin passes through the fuze body.

c. The motor assembly consists of a tube which houses the propellant and igniter. The fin assembly is securely attached to this tube. The front end of the tube is assembled to the base of the fuze. The rear end forms a nozzle. The cylindrical motor cavity is divided into four

sections by two spacer plates which support the grains of propellant powder.

d. Each grain of propellant is 5-in. long and approximately 3/8-in. in diameter. Three grains are placed in each of the four sections formed by the spacer plates. Each lot of propellant is adjusted at the time of manufacture to give standard velocity. The igniter ignites the propellant.

e. The igniter consists of a short, cylindrical plastic case containing a small black powder charge and an electrical squib. It is assembled in the forward end of the motor on top of the propellant, spacer plates. The leads of the electrical squib, running parallel to the grains of propellant, pass from the igniter through the nozzle into the expansion cone. A green lead (ground) wire is connected to the aluminum support ring of the contact ring assembly. A red lead (positive) wire is attached to a pin which is insulated from the support ring, but is in contact with the copper contact band. These connections are positioned 180° apart. Blue lead is used for test purpose only.

f. The fin assembly consists of six aluminum alloy fins and a contact ring assembly. The contact ring assembly, which encircles the fins, consists of three rings. The aluminum support ring, which is innermost, is separated from the copper contact ring by a plastic insulating ring. The fins are spot welded to the expansion cone, and the expansion cone is press fitted to the rear of the motor tube. The M24 and the M66 off-route mines utilizing M28A2 HEAT rockets are described in TM 43-0001-36.

Differences between Models:

The BD rocket fuze M404A1 is similar to BD rocket fuze M404A2. The M404A1 differs principally in minor design changes of the functioning parts and the shape of the safety band.

Functioning:

a. When the safety band is removed, the ejection pin moves outward approximately 3/8 of an inch but still prevents all parts of the fuze mechanism from moving. When the rocket is in the firing chamber, the ejection pin is partially depressed by the chamber, thereby freeing the setback sleeve so it can move to the rear when the rocket is fired. The fuze is still safe, since the ejection pin prevents movement of the actuating sleeve and firing pin.

b. If it becomes necessary to remove the rocket from the launcher, the ejection pin will move outward and re-engage the setback sleeve. This returns the fuze to its original safe condition.

c. When the rocket is fired, the force of inertia causes the setback sleeve to move rearward. It is held in its rearward position by the lockpin. When the rocket leaves the muzzle of the launcher, the ejection pin is thrown clear of the fuze by the ejection pin spring. The fuze is then fully armed.

d. During flight, the firing pin lever and firing pin spring prevent the firing pin from striking the detonator. The creep spring retards the forward movement of the plunger and actuating sleeve. The action of the creep spring prevents the fuze from firing should the rocket strike light objects such as thin brush or undergrowth.

e. Upon impact with a more resistant object, the plunger and actuating sleeve move forward until the sleeve hits the firing pin lever. This causes the firing pin to strike and detonate the warhead.

Tabulated Data:

Rocket:

Model ----- M28A2
 Type ----- Service
 Diameter ----- 3.5 in.
 Length (max) -- 23.55 in.
 Weight ----- 9.00 lb

Performance:

Operating
 temperature
 limits ----- -20° to +120°F
 (-28.6 to +48.4C)

Muzzle velocity
 (at 70°F)
 (approx) ----- 325 ft/sec
 (99 mps)

Warhead:

Type ----- HEAT
 Body ----- Steel
 Color ----- Olive drab w/yellow
 markings
 Diameter ----- 3.5 in.
 Length ----- 10.5 in.
 Weight ----- 4.47 lb

High-explosive train:

Detonator ----- M41
 Booster
 (teteryl) ----- 0.17 oz (4.81 g)
 Filler (warhead)
 Type ----- Comp B
 Weight
 (approx) ----- 1.88 lb (.854 kg)

Fuze:

Model ----- M404A1 or M404A2
 Type ----- Base detonating
 Diameter ----- 2.0 in.

Length:

Overall ----- 3.48 in.
 To shoulder
 (max) ----- 2.94 in.
 Weight ----- 1.16 lb
 Arming
 distance ----- 10 ft (3.05 m)

Motor:

Diameter (at
 fins) ----- 3.5 in.
 Length ----- 10.41
 Weight ----- 3.30 lb
 Thrust ----- 6,000 - 10,000 lb

Propelling initiating train:

Igniter:

Model ----- M20A1
 Charge (black
 powder) ----- 0.13 ± 0.007
 (3.5 ± .2 g)

Electric

squib ----- M2

Propelling charge:

ROCKET, PRACTICE, 3.5-INCH M29A2

Type Classification:

STD (LLC-B) AMCTCM 36841 (M29A2)

Use:

For training personnel in use, care and handling of service rockets.

Description:

a. The warhead is completely inert. The practice rockets can be fired at buttoned-up, modified target tanks without danger to tank crews. The practice rockets have the same flight characteristics as the HEAT rocket.

b. The dummy fuze rocket M405 which serves as a coupling for the warhead and motor, is cylindrical. It is threaded externally at the forward end to fit into the

warhead assembly, and internally at the rear end to receive the motor assembly. A safety band fits around the seals and fuze. This fuze incorporates a double-locking, bore-riding, round ejection pin assembly simulating that used in base detonating (BD) fuze M404A2. The body of the fuze and the safety band are painted blue.

c. The motor assembly consists of a tube which houses the propellant and igniter. The fin assembly is securely attached to this tube. The front end of the tube is assembled to the base of the fuze. The rear end forms a nozzle. The cylindrical motor cavity is divided into four sections by two spacer plates which support the grains of propellant powder.

d. Each grain of propellant is 5-in. long and approximately 3/8-in. in

CARTRIDGE, 12 GAGE, SHOTGUN, No. 00

ARD80-0067

Type Classification:

Std OTCM 36841

Use:

For Military Issue Shotgun 2-3/4 inch Chamber.

Description:

Paper ctg case loaded with smokeless powder and No. 00 Commercial Shot.

Purpose:

The cartridge is intended for guard and combat use.

CARTRIDGE, CALIBER .30, BALL, MATCH, M72

ARD80-0085

Type Classification:

Std - OTCM 37119.

Use:

Rifle, Claiber .30, M1 and National Match, Caliber .30, Rifles.

Description:

MATCH Cartridge. The cartridge is identified by head stampings on the base of the cartridge case with either the initials NM (National Match) or the word MATCH. The primer is uncrimped, the bullet has no crimped cannellure and the case is not crimped to the bullet.

Purpose:

This cartridge is not designed to be fired in any weapon except those designated as competition rifles.

CARTRIDGE, CALIBER .45, BALL, HIGH PRESSURE TEST, M1

ARD80-0091

Type Classification:

Std - OTCM 36841

Use:

For Test of all Caliber .45 Weapons.

Description:

HIGH PRESSURE TEST Cartridge. The cartridge is identified by a stannic-stained (silvered) cartridge case.

Purpose:

The cartridge is used for proof testing
Caliber .45 Pistols and Submachine Guns
during manufacture, test, or repair.

Tabulated Data:

CARTRIDGE, 5.56-MM, BLANK, M200

ARD80-0121

Type Classification:

Std - AMCTC 5942

Use:

Rifle, 5.56-MM, M16 and M16A1.

Description:

BLANK Cartridge. The cartridge is identified by a rose-petal (rosette crimp) closure of the cartridge case mouth. In addition, an engraved knurl is located 1/2 inch from the head of the cartridge case.

Purpose:

This cartridge is designed for simulated firing in training exercises and for saluting purposes.

Tabulated Data:

DODAC ----- 1305-A080
 Weight ----- 107 grain
 Length ----- 1.90 inch
 Tracer ----- NA

CARTRIDGE, 5.56MM: BLANK, M755

Type Classification:

Std. MSR 04786005

Use:

The M755 blank cartridge is especially designed for use with the Sting Ring Airfoil Munition System which consists of the M234 launcher and the 64mm Riot Control M743 Projectile fired from the M16A1 rifle.

Description:

The Cartridge, 5.56mm: Blank, M755 is only for use with the M234 riot control 64 millimeter projectile launcher. The

launcher is attached to the flash suppressor of the M16A1 rifle and actuated by firing an M755, 5.56mm blank cartridge. The M755 blank cartridge is the only cartridge that will give the projectile M743 the proper velocity. Use of other blank cartridges may damage the system.

The cartridge is loaded with 12 grains of Dupont Hi Skor 700X propellant closed with a seven petal nose crimp and moisture sealed. The crimped tips of the cartridge is painted with yellow lacquer for identification and thus lessen the chance of mixing them with the standard M16A1 rifle blank cartridges.

CARTRIDGE, 5.56MM, PLASTIC, PRACTICE, M862

ARD 85-2397

Type Classification:

Std - MSR02846001

Use:

Rifle, 5.56MM, M16A1 W/XM2 Practice Bolt.

Description:

Practice Cartridge. This cartridge is identified by a blue bullet tip.

Purpose:

This training cartridge is for training in local and urban training areas where range restrictions preclude use of full range standard service ammunition.

Tabulated Data:

| TM 9-1005-249-10 |
| TM 9-1300-206 |
| SB 700-20 |

Purpose:

The blank cartridge is fed into the firing chamber. When fired the primer ignites the propellant. The expanding propellant gasses pass from the muzzle of the rifle into the launcher manifold. The projectile is ejected from the launcher barrel. The propellant charge is not sufficient to eject the cartridge case which must be ejected by pulling the charging handle of the rifle all the way back.

CARTRIDGE, 7.62-MM, HIGH PRESSURE TEST, M60

ARD80-0124

Type Classification:

OBS - MSR-11756003

Use:

All 7.62-MM Weapons.

Description:

HIGH PRESSURE TEST Cartridge. The cartridge is identified by a stannic-stained (silvered) case.

Purpose:

The cartridge is loaded with a special propellant to produce pressures substantially in excess of the service cartridge; the cartridge is not for field issue, but is used for proof firing of weapons during manufacture, test, or repair.

DUMMY CARTRIDGE, 7.62-MM, M63

ARD80-0128

Type Classification:

Std - OTCM 36841

Use:

Machine Guns, 7.62-MM, M60, M219 and M240;
Rifle, 7.62-MM, M14.

Description:

DUMMY Cartridge. The cartridge is identified by six longitudinal corrugations (flutings) on the cartridge case. In addition, there is no primer, and no vent hole in the primer pocket.

Purpose:

This is a dummy cartridge used for practice in loading 7.62-MM weapons for simulated firing to detect flinching of personnel during firing and for inspecting and testing the weapon mechanism.

CARTRIDGE, 7.62MM, GRENADE, M64

ARD80-0129

Type Classification:

OBS - MSR 11756003

Use:

Rifle, 7.62MM, M14.

Description:

GRENADE Cartridge. The cartridge is identified by a rose-petal (rosette crimp) closure of the cartridge case mouth and sealed with red lacquer.

Purpose:

This cartridge provides pressure to project rifle grenade to a desired target when using a grenade projection adapter and Dragon missile launch effect trainer (LET).

Tabulated Data:

diameter. Three grains are placed in each of the four sections formed by the spacer plates. Each lot of propellant is adjusted at the time of manufacture to give standard velocity. The igniter ignites the propellant.

e. The igniter consists of a short, cylindrical plastic case containing a small black powder charge and an electrical squib. It is assembled in the forward end of the motor on top of the propellant spacer plates. The leads of the electrical squib, running parallel to the grains of propellant, pass from the igniter through the nozzle into the expansion cone. A green lead (ground) wire is connected to the aluminum support ring of the contact ring assembly. A red lead (positive) wire is attached to a pin which is insulated from the support ring, but is in contact with the copper contact band. These connections are positioned 180° apart. Blue lead is used for test purpose only.

f. The fin assembly consists of six aluminum alloy fins and a contact ring assembly. The contact ring assembly, which encircles the fins, consists of three rings. An aluminum support ring, which is innermost, is separated from the copper contact ring by a plastic insulating ring. The fins are spot welded to the expansion cone; the expansion cone is press-fitted to the rear of the motor tube.

Differences between Models:

a. The M29A1 and M29A2 rockets are similar in appearance to the M28A2. The M29 series differ in that they have a crimping groove at the juncture of the warhead body and ogive. The rockets of an early manufacture are assembled with M28A2 rocket warhead metal parts inert loaded with plaster of paris.

b. The M29A1 warhead differs from the M29A2 warhead in the head and trap and

spacer assembly. The ogive is attached to the head body of four screws staked to the ogive. Some rockets may have the cast trap and square spacer blades.

The warhead being inert, no functions occur when the rocket is fired. The rocket is strictly for training purpose.

LIGHT ANTITANK WEAPON (LAW) SYSTEM M72 SERIES

ARD80-0504A

ARD80-0504B

ROCKET, HEAT, 66MM, M72, M72A1, M72A2, AND M72A3

Type Classification:

M72 & M72A1 OBS-MSR-05806019.
M72A2 - STD LCC-B-MSR-09806022.
M72A3-STD LCC-A-MSR-09806021.

Use:

Primarily for penetration of armored targets. It may be used effectively against bunkers and other light field of fortifications.

a. Launcher.

b. Rocket.

Description:

a. The packaged compact portable weapon is issued as a single shot shoulder-fired launcher with a HEAT rocket and sling assembly. The rocket launcher is a tubular, telescoping, smooth-bore, open-breech

type weapon. The outer (front) tube is made of plastic, impregnated fiberglass; the inner (rear tube) is made of aluminum. The inner tube is oriented with respect to the outer tube by the channel assembly, which rides in an alignment slot in the trigger housing assembly. The tubes are locked in the open position when the detent assembly drops into the rectangular hole in the trigger housing assembly.

b. The fin stabilized rocket in this system contains a shaped charge warhead with a point initiating base detonating (PIBD) fuze. The fuze contains a 2-wire system from the piezo electric element on the warhead to the fuze detonator which provides electrical fuze initiation when the nose crystal is struck. In addition, the fuze has a mechanical inertial graze element as a secondary means of functioning

Differences between Models:

The M72A2 rocket is similar to the M72A1 with the exception of the warhead which contains a precision shaped charge liner cone. This provides greater target penetration than the M72A1. There is also a minor change in the wiring between the piezo electric element and fuze, otherwise the two systems are identical. The M72A3 is similar to M72A2.

WARNING

Wear ear plugs when firing the weapon.

The 100 and 150 meter markings on the front sight are coated with radioactive material, then laminated between two sheets of plastic. If sight is broken, remove and place in a plastic sealed bag. Return bag to ammunition disposal personnel.

Functioning:

a. Extending the launcher into the extended or firing position automatically locks the weapon.

b. After the trigger safety handle is released, the trigger is depressed. This releases the channel assembly which drives the firing pin into the primer of the rocket motor igniter. This ignites the black powder in the flash tube, which in turn, ignites the integral igniter of the rocket motor. The igniter initiates the propellant. The burning propellant propels the rocket from the launcher.

c. Upon target impact, the fuze train detonates the charge which collapses the copper liner into a finger shaped jet. The jet is preceded by extremely hot, high velocity gases which melt a hole in the target. The copper jet then penetrates into the target. Almost simultaneously the body

and ogive are blasted into small fragments by the detonated octol charge. These fragments travel adjacent to, and aft of the line of fire.

CHAPTER 3

AIRCRAFT ROCKETS

2.75-Inch

Complete Rounds:

a. Complete rounds can be assembled in the combinations in table 3-1. They may be fired from the M157, M158, M159C, M3 or M200 2.75-Inch

Aircraft Rocket Launchers.

b. The rockets can be issued unassembled. This chapter contains information pertaining to the components of the unassembled rockets.

TYPICAL 2.75-INCH AIRCRAFT ROCKET (LSFFAR)

ARD80-0508

ROCKET, FLECHETTE, 2.75-INCH, WDU-4A/A

ARD80-0509

Type Classification:

STD (LCC-A) AMCTCM 47560 Nov 69

Use:

The warhead contains flechettes and is used against personnel.

Description:

a. The complete round consists of a warhead with an integral fuze and rocket motor.

b. The warhead consists of 3 main parts: a nose section, a body, and an integral fuze. The nose section, a plastic cone bonded to a metal plate, is attached to the body by shear pins. The body is a

hollow cylinder loaded with 20 grain flechettes. The most recently manufactured WDU-4A/A warheads contain three tracers for the purpose of assisting the pilot/gunner in identifying the beaten zone of the flechette impact pattern. Two semicylindrical sleeves retain the flechettes in place. A metal pusher plate is located just aft of the flechettes. The threaded end of the body is machined internally to accommodate a base-detonating (BD) fuze.

c. The low-spin folding-fin aircraft rocket (LSFFAR) is an air-to-ground rocket primarily deployed from rotary-wing and other low-speed aircraft. However, it is also used on Air Force and Navy jet aircraft in ripple fire and in a restricted single fire mode.

d. The rocket motor is described in Chapter 5.

Differences between Models:

The Mk 40 Mods 1 and 3 have integral bulkhead motor tubes whereas the Mk 40 Mod 0 has nonintegral bulkhead tube. The igniter of the Mod 3 motor differs from that of the Mods 0 and 1 motors in that the igniter has been modified to incorporate a carried, frangible case in lieu of the blow-out plug. Also, the squib is located on the periphery instead of the center of the case.

Functioning:

a. The rocket motor functions when current passes through the launcher firing contact to the igniter in the rocket motor. This current generates the heat necessary to initiate the igniter charge which ignites the propellant grain. Combustion gases from the burning propellant pressurizes the chamber and exhaust through the nozzle, providing the unequal forces required for rocket thrust.

b. Functioning of the fuze sets off an expelling charge which forces the pusher plate, flechettes and semicylindrical sleeves forward. This shears the pins attaching the nose cone to the body and expels the flechettes into the slipstream ahead of the rocket.

GRENADe, GENERAL PURPOSE, HE: M73
MULTIPURPOSE SUBMUNITION (MPSM), HIGH EXPLOSIVE

M73 SUBMUNITION

Type Classification:

STD (LCC-A).

Use:

The M261 warhead contains 9 each MPSM's M73 for use against personnel, materiel, and light armor.

Description:

The submunition grenade consists of a full caliber, cylindrical tapered steel casing, prescored internally for controlled fragmentation, a Ram Air Decelerator (RAD) device for orientation and stabilization, a truncated

shaped charge liner, wave shaper and the M230 omni-directional fuze with explosive train. The kill mechanism is a truncated subcaliber, 44° included angle, shaped charge copper liner 33.02mm (1.3 in.) high. The submunition detonation is initiated by the M230 fuze which is armed by the action of the Ram Air Decelerator on ejection from the warhead.

Functioning:

When the warhead fuze functions, the expulsion charge is initiated and, by means of a pusher plate, presses the submunitions forward until the nose cone retaining pins are sheared and the submunitions are expelled into the airstream.

The RAD high drag device inflates and turns the submunition forward and toward the ground. The shock of inflation by Ram air forced through holes in the air-scoops in the RAD exerts a strong drag on the arming stem in the M230 fuze, in excess of 20 pounds, which breaks the safety shear wire. The fuze arming stem retracts approximately 0.125 inch and the arming pin at the base of the stem is withdrawn from the slider. The slider is then driven across the runaway escapement delay mechanism by its spring to bring the detonator into line with the firing pin. The fuze is now fully armed. If the submunition should be subjected to an impact force applied in any direction (as striking the ground or a vehicle), the sensing mass will move and release the locking ball holding back the spring loaded firing pin. The firing pin is driven forward and initiates the M55 stab detonator. The detonator sets off, in sequence, the explosive lead, the booster charge, and the high explosive main charge. The shaped charge lines penetrates light armor or other material in line with its axis and the submunition body shatters into small, high velocity fragments to defeat soft targets.

Tabulated Data:

TM 43-0001-28

C.875
CARTRIDGE, 81 MILLIMETER: TARGET PRACTICE M879 WITH FUZE, PD, M751

IGNITION CARTRIDGE (W/INTEGRAL PRIMER)

U
AR 4501

Type Classification:

TBD

Use:

This cartridge is a full range training round for use in the M252 improved 81mm mortar system.

Description:

This cartridge consists of a PD (practice) fuze, an inert loaded projectile body, fin assembly, four propellant increments, obturating ring and an ignition cartridge (with integral primer). The cartridge with the M751, PD fuze resembles the 81MM M821 HE cartridge. These practice cartridges are ballistic matches to the HE cartridges and produce a similar signature (flash, audible sound, and smoke cloud) upon impact on the ground.

Functioning:

When the cartridge is loaded, it slides down the mortar tube until the percussion primer in the ignition cartridge strikes the firing pin in the base cap of the mortar. The primer ignites the ignition cartridge which ignites the propellant charge. Gases from the burning propellant expel the projectile from the mortar tube and propel it to the target. The projectile is fin-stabilized in flight. The acceleration arms the fuze. The cartridge travels down-range and impacts the target. The fuze

functions on impact. A pyrotechnic smoke charge in the fuze produces a flash, an audible sound, and a smoke cloud.

Tabulated Data:

Complete Round:

| | |
|--------------|-----------------------|
| Type | Practice (full range) |
| Weight | 9.40 lb |

CARTRIDGE, 40-MILLIMETER: HEI-T, SD, MK11, MK2, MV2890

AR199875

AR 199874

Type Classification:

Std OTCM 37119 dtd 1959.
(MK2 only, CON MSR 11756003)

Use:

This fixed ammunition is used in 40-mm gun cannons for firing against materiel.

Description:

The relatively thin-walled projectile contains a burster charge, an incendiary charge, a point-detonating (PD) fuze, and a shell-destroying (SD) tracer. The projectile nose is threaded to receive the fuze. The shell-destroying tracer assembly is contained in the boat tailed base of projectile, which is internally threaded, and extends approximately 0.60-inch beyond the base. The shell-destroying tracer consists of an igniting charge, a red tracer composition, and a relay igniting charge. The cartridge case, either brass or steel, is crimped rigidly to the projectile by means of a 360° crimp. The base of the cartridge case contains a percussion primer consisting of a perforated tube containing black powder and a percussion element.

Functioning:

When the firing pin of the weapon strikes the percussion primer, the black powder in the primer tube is ignited. Sparks from the black powder ignite the propellant charge to impart velocity to the projectile and to ignite the tracer. The high explosive bursting charge is detonated either by the fuze upon contact with the target, or by the tracer relay igniting charge. The tracer composition burns with a visible trace for 8 to 10 seconds.

Difference Among Models:

Cartridges manufactured by the Navy may be distinguished by the painting on the fuzes: the fuze for the Navy HEI-T cartridge is painted red and white (red tip on fuze.)

CARTRIDGE, 90-MILLIMETER: HE-T, M71A1 AND HE, M71

AR199839

AR199838

Type Classification:

Std OTCM 37436 dtd 1960 (M71A1)
CON MSR 11756003 (M71)

Use:

These cartridges are used in 90-mm guns against personnel and materiel, producing blast and fragmentation at the target.

Description:

The hollow steel forged projectile has a boattailed base and a streamlined ogive. Fuze cavity may be normal or deep cavity type. The projectile is loaded with 2.15 pounds (1.68

pounds, deep cavity) of Composition B or TNT. A tracer is threaded into the projectile base (M71A1). A point detonating fuze is assembled to the projectile. Loaded projectile weights fall into one of three weight zones.

Functioning:

When the weapon is fired, the burning propellant ignites the tracer and creates gases which propel the projectile out of the gun tube. The tracer burns for a minimum of three seconds. Upon impact, the fuze functions on superquick or delay, as preset, and detonates the high explosive filler, producing blast and fragmentation.

Difference Between Models:

M71A1 has a tracer; M71 does not. M71A1 has M1 propellant resulting in lower velocity; M71 has M6 or M15 propellant.

CARTRIDGE, 90 MILLIMETER: HEAT, M348A1 (T108E46) AND M348 (T108E40)

Type Classification:

OBS AMCTC 6267 dtd 1968.

Use:

This cartridge is fired from 90mm gun cannons against armored targets.

Description:

The cartridge consists of a fin-stabilized steel projectile containing a high explosive shaped charge and a brass cartridge case loosely filled with propellant. An inverted copper cone liner in the front of the projectile serves to shape the Comp B charge, and a streamlined windshield houses a piezoelectric element to

initiate the PIBD fuze in the base. An obturator band encircles the projectile above the lip of the cartridge case. An igniter and fin assembly is threaded into the base of the projectile and extends the length of the cartridge case through the propelling charge. The igniter is a perforated shaft filled with 400 grains of black powder. The four fixed fins are attached to the base of the assembly, and the igniter tube is closed with a threaded retainer containing approximately 20 grains of black powder. The percussion primer is in turn threaded into the retainer, flush with the base of the cartridge case, and contains 7 grains of black powder. The interior of the cartridge case is fitted with guided rails for the projectile fins. A filling plug is threaded into

the base of the cartridge case for filling the case with the propelling charge after cartridge assembly.

Functioning:

When the primer is struck by the firing pin of the weapon, the black powder is ignited through primer, retainer, and igniter to flash through the igniter perforations and ignite the propelling charge. Rapidly expanding gases from the burning propellant force the projectile through the gun barrel with a velocity of 2800 feet per second. The obturator expands to prevent escape of gas pressure past the projectile while it is in the barrel, and the fins stabilize the projectile in flight. Upon impact with the target, distortion of the piezoelectric unit generates an electric current to initiate the fuze and detonate the explosive charge. As the copper cone is crushed, the detonation results in an intensely focused, high velocity shock wave which causes failure of the target armor, and a jet of molten metal penetrates the target interior.

Difference between Models:

Model M348 has a cone tube extension which is not present in the M348A1. The fin cross-section of the M348 is rectangular while that of the M348A1 is T-shaped.

CARTRIDGE, 90-MILLIMETER: BLANK, M394

Type Classification:

Std OTCM 38091 dtd 1962

Use:

This blank cartridge is provided for saluting purposes and simulated firing in 90-mm guns.

Description:

The cartridge consists of a cartridge case, a primer, and a charge of black powder. A polystyrene closing cup is used to seal the charge inside the case.

Functioning:

After the primer is initiated by the firing pin of the weapon, the black powder charge is ignited, producing a loud report and flash.

Tabulated Data:

Complete round:

Type ----- Blank
Weight ----- 8.23 lbs.
Length ----- 7.27 in.

Cannon used with ---- M36, M41 or M54
Components:

Body material ----- Brass or aluminum

Filler and weight ---- Black powder and potassium nitrate-
1.75 lb.

Cartridge case ----- M27, M27B1

Primer ----- M1A2

Temperature Limits:

Firing:

Lower limit ----- - 40°F
Upper limit ----- + 125°F

Storage:

Lower limit ----- - 80°F (for period not
more than 3 days)
Upper limit ----- + 160°F (for period not
more than 4 hrs/day)

*Packing ----- 1 cartridge in fiber
container; 8 containers
per wooden box

*Packing Box: "

Weight ----- 98.6 lbs.

Dimensions ----- 25-13/16 x 12-15/16
x 10-23/32 in.

Cube ----- 2.12 cu. ft.

*NOTE: See SC for complete packing data
including NSN's.

Shipping and Storage Data:

Quantity-distance

class ----- 4

Storage

compatibility ----- E

DOT shipping class ----- B

DOT designation ----- AMMUNITION FOR
CANNON WITHOUT
PROJECTILES

DODAC ----- 1315-C261

Drawing number ----- 7549210

Limitations:

Closure debris from blank ammunition can be
expelled a distance of 300 feet forward of the
weapon muzzle.

CARTRIDGE, 105-MILLIMETER: APDS-T, M392A2 AND M392

Type Classification:

M392A2 ----- Std MSR 02787001

M392 -----Std OTCM 38116
dtd 1961

Use:

This cartridge is a hypervelocity armor-piercing type with discarding sabot, intended for use in 105-mm guns against armored targets.

Description:

The projectile consists of a sheathed tungsten carbide core with tracer and a sabot. The core, which is the armor-piercing element, is

carried within the sheath with the sabot assembled on the exterior surface. A plastic band is positioned on the outside diameter of the sabot at the forward end. A fiber rotating band and a rubber obturator are assembled on the outside diameter near the base of the sabot. The igniter tube of the electric primer extends almost the entire length of the propellant loosely packed in the cartridge case.

Functioning:

The electrically initiated primer ignites the propelling charge. Gases produced by the burning propellant propel the projectile from the gun and ignite the tracer which burns for a minimum of 2.5 seconds. Setback, centrifugal and air pressure forces cause the sabot to discard upon leaving the gun tube. The

sheathed core is spin stabilized and penetrates target solely by kinetic energy.

Difference Between Models:

The M392 cartridge is of United Kingdom manufacture and bears the U. K. designation of L36A1. The M392 is fitted with U. K. Primer L4A1 or L4A2.

Tabulated Data:

Complete round:

Type ----- APDS-T
Weight ----- 41.0 lbs.
Length ----- 33.0 in.

CARTRIDGE, 105 MILLIMETER: HE, M1

AR199734

Type Classification:

Std AMCTC 4181 dtd 1966

Use:

The projectile of this cartridge contains high explosive and is used for fragmentation, blast, and mining in support of ground troops and armored columns.

Description:

The projectile consists of a hollow steel forging with a boattail base, a streamlined ogive, and gilding metal rotating band. A base cover is welded

to the base of the projectile for added protection against the entrance of hot gases from the propelling charge during firing. The high explosive (HE) filler within the projectile may be either cast TNT or Composition B. A fuze cavity is either drilled or formed in the filler at the nose end of the projectile. This cavity may be either shallow or deep. A cavity liner, to preclude dusting of HE during transportation and handling, is seated in the cavity and expanded into the lower projectile fuze threads. A supplementary charge is placed in the fuze cavity of projectiles having deep cavities. Projectiles with shallow cavities or deep cavities containing a supplementary charge use only short intrusion

Change 12

3-9

fuze, PD, or MT. Those with deep cavities will accept the long intrusion proximity fuze after removing the supplementary charge. Projectiles may be shipped with a PD or MTSQ fuze or with a closing plug. When shipped with a closing plug, a chip board spacer is assembled between the supplementary charge and plug to limit movement of the former during transportation and handling.

The cartridge case contains a percussion primer assembly and seven individually bagged and numbered propelling charge increments. The base of the cartridge case is drilled and the primer assembly is pressed into the base. The percussion primer assembly consists of a percussion ignition element and a perforated flash tube containing black powder. The seven numbered increment bags are tied together, in numerical order, with acrylic cord. These are assembled into the cartridge case, around the primer flash tube, with Increment 1 at the base of the cartridge case and Increment 7 toward the mouth of the cartridge case.

Functioning:

If the projectile is unfuzed, the closing plug is removed and a fuze assembled to the projectile prior to adjusting the charge and loading the cartridge into the weapon. Impact of the weapon firing pin results in the initiation of the percussion primer which, in turn, ignites the black powder in the flash tube. The flash tube provides for uniform ignition of the propelling charge producing a rapid expansion of the propellant gas which propels the projectile out of the weapon tube. Engagement of the projectile rotating band with the rifling of the weapon tube imparts spin to the projectile providing inflight stability. Projectile functioning is dependent upon the fuze used and may function on impact (instantaneous or delay), function above ground either at a predetermined height based upon time of flight or function in proximity with the target area. Fuze function detonates the HE projectile filler resulting in projectile fragmentation and blast.

PROJECTILE, 155 MILLIMETER: HE, M107 (NORMAL AND DEEP CAVITY)

AR199685

AR199684

Type Classification:

Deep Cavity: Std OTCM 36841, dtd 1958.
 Normal Cavity: Std OTCM 36841, dtd 1958.

Use:

This projectile is fired from 155mm howitzers and is used for blast effect, fragmentation, and mining.

Description:

The projectile is a hollow steel shell filled with 14.6 pounds of TNT or 15.4 pounds of

Composition B. The shape is ogival with a boat-tail for aerodynamic efficiency. A supplementary charge of 0.3 lb. TNT is contained in an aluminum liner in the deep fuze cavity. A threaded lifting plug closes the fuze cavity at the nose of the projectile for handling and storage. Point detonating, time or proximity (deep cavity only) fuzes may be used with this projectile. When a proximity fuze is fitted, the supplementary charge is removed. A rotating band encircles the shell casing near the base and is protected by a grommet before loading. A steel plate (base cover) is welded over the base to prevent entry of hot propellant gases into the projectile interior.

Functioning:

When the weapon is fired, the burning propellant charge generates rapidly expanding gases to propel the projectile through the barrel with the velocity required to reach the target. The soft alloy rotating band engages the barrel rifling to impart spin to the projectile for stability in flight. If a point detonating fuze or time fuze is employed, the fuze detonates the supplementary charge on impact (PD) or after the preset time (MT), and the supplementary charge detonates the projectile filler. When a proximity fuze is used, detonation occurs on approach to the target (proximity action). The proximity fuze contains its own booster element to initiate the warhead filler.

Difference Between Models:

155mm HE Projectile M107 (Normal Cavity) has a shallower fuze receptacle and cannot accommodate proximity fuzes. Because of the absence of a supplementary charge, the basic Composition B charge of 15.4 lbs is slightly greater than in the deep cavity projectile.

PROJECTILE, 8 INCH: HE, M106

AR199705

AR199704

- Type Classification:

Std OTCM 36841 dtd 1958

Use:

This projectile is used against personnel and materiel, producing blast and fragmentation at the target.

Description:

The projectile consists of a hollow steel forging with a boattailed base, a streamlined ogive, and a gilding metal rotating band. A base cover is welded to the base of the projectile for added protection against the en-

trance of hot gases from the propelling charge during firing. The nose of the propelling is fitted with a thread eyebolt-lifting plug to facilitate handling and provide a closure for the fuze cavity. The projectile is made with either a shallow or deep fuze cavity and may be loaded with TNT or Composition B. Deep cavity projectiles contain a supplementary charge in the fuze cavity. A cardboard spacer is placed in the fuze cavity between the supplementary charge and the lifting plug to limit movement of the supplementary charge during shipping and handling. The rotating band is protected by a removable grommet. The loaded projectile is zoned into one of five weight zones ranging from 191.4 to 204.3 pounds. The weight zone of the projectile is

Change 8

3-131

indicated by the number squares and prick punch marks on the ogive of the projectile.

Functioning:

The grommet and lifting plug are removed from the projectile and the projectile is fitted with one of the authorized fuzes and rammed into the weapon chamber. When deep cavity projectiles are fitted with a proximity fuze the supplementary charge is removed. Fuze arming occurs after firing, during projectile flight downrange. Depending upon the type of fuze fitted, the fuze functions detonating the projectile on impact, after an elapsed time or on sensing of the target.

CARTRIDGE, 60 MILLIMETER: HE, M49A3 (M49A2E1) AND M49A2

Type Classification:

M49A3: Std AMCTC 6632, dtd 1969.

M49A2: Std OTCM 37119, dtd 1959.

Use:

This cartridge is fired in 60mm Mortars M2 or M19 for use against personnel and materiel, providing both fragmentation and blast effect.

Description:

The complete round consists of a projectile body, a point-detonating fuze (staked), a fin assembly, four increments of propellant charge, an ignition cartridge, and a percussion primer. The projectile body is of pearlitic malleable iron (PMI), and is threaded internally at the

nose to accept the fuze and at the base to accept the fin assembly. The body is filled with Composition B high explosive.

Functioning:

When the cartridge is loaded, it slides down the mortar tube until the percussion primer in the ignition cartridge strikes the firing pin in the base cap of the mortar. The flash from the primer ignites the ignition cartridge, and the cartridge ignites the propellant charge. Rapidly expanding gases from the burning propellant expel the projectile from the mortar tube and propel it to the target. The projectile is fin-stabilized in flight. The point-detonating fuze functions on impact, detonating the fuze booster charge and, in turn, the high explosive charge. The high explosive charge shatters the projectile

body, producing near optimum fragmentation and blast effect at the target.

Difference Between Models:

The projectile body of the M49A2 is of forged steel, and is filled with flaked TNT.

Tabulated Data:

Complete round:

Type-----HE
Weight w/fuze-----3.07 lb
Length w/fuze-----9.61 in.

CARTRIDGE, 60 MILLIMETER: HE, M49A5 (M49A4E1)

AR199514

AR199513

Type Classification:Use:

This cartridge is used against personnel and light materiel, providing both fragmentation and blast effect.

Description:

The complete round consists of a projectile body, a fin assembly, two increments of propellant charge, and an ignition cartridge with a percussion primer. The alloy steel projectile body is internally threaded at the nose to accept the fuze, externally threaded at the base to accept the fin assembly, and grooved to hold

the Delrin obturating ring. The body is loaded with Composition B high explosive.

Functioning:

When the cartridge is loaded, it slides down the mortar tube until the percussion primer in the ignition cartridge strikes the firing pin in the base cap of the mortar. The flash from the primer ignites the ignition cartridge, and the cartridge ignites the propellant charge. Rapidly expanding gases from the burning propellant expel the projectile from the mortar tube and propel it to the target. The projectile is fin-stabilized in flight. The point-detonating fuze functions on impact, detonating the fuze booster charge and, in turn, the Composition B high explosive. The bursting charge shatters the projectile body, producing near optimum fragmentation and blast effect at the target.

CARTRIDGE, 60 MILLIMETER: TARGET PRACTICE, M50A3 (M50A2E1)

AR199512

AR199511

Type Classification:

C & T AMCTC 6632, dtd 1969.

Use:

This cartridge is fired in 60mm Mortars M2 and M19 for target practice, and contains a spotting charge for observation.

Description:

The complete round consists of a projectile body, a point-detonating fuze, a fin assembly with a 2-in. extension, four increments of propellant charge, and an ignition cartridge with a percussion primer. The projectile body is of forged steel or pearlitic malleable iron (PMI), and is threaded internally at the nose to accept

the fuze and at the base to accept the fin extension. The body is loaded with an inert plaster filler to simulate the weight and ballistic characteristics of a high explosive cartridge. A pellet of black powder for a spotting charge is loaded in a cavity just below the booster casing of the fuze.

Functioning:

When the cartridge is loaded, it slides down the mortar tube until the percussion primer in the ignition cartridge strikes the firing pin in the base cap of the mortar. The flash from the primer ignites the ignition cartridge, and the cartridge ignites the propellant charge. Rapidly expanding gases from the burning propellant expel the projectile from the mortar tube and propel it to the target. The projectile is

Change 7

4-9

fin-stabilized in flight. The point-detonating fuze functions on impact, detonating the fuze booster charge and the spotting charge.

Tabulated Data:

CARTRIDGE, 60 MILLIMETER: TRAINING, M69

AR199510

AR199509

Type Classification:

Std OTCM 37119, dtd 1959.

Use:

This cartridge is used for training in the loading and firing of 60mm Mortars M2 and M19.

Description:

Unlike other mortar ammunition, the components of this round are issued separately. This facilitates replacement of damaged, worn, or expended parts. The complete round consists of an inert projectile, a fin assembly, an ignition cartridge, and a percussion primer. The pear-shaped, cast iron projectile has no provision

for a fuze, and is internally threaded at the base to accept the fin assembly.

Functioning:

When the cartridge is loaded, it slides down the mortar tube until the percussion primer in the ignition cartridge strikes the firing pin in the base cap of the mortar. The primer detonates the ignition cartridge. Since this round is fired only at Charge 0, the gases from the ignition cartridge expel the projectile from the mortar tube and propel it to the target. The projectile is fin-stabilized in flight. Since the cartridge is inert, there is no detonation upon impact, and the cartridge may be recovered for reuse.

CARTRIDGE, 81MM: MORTAR TRAINING DEVICE, 81MM SABOT (INERT) M1 AND 22MM
SUB-CALIBER PRACTICE CARTRIDGE M744, M745, M746 AND M747

AR 100575 A

AR 100577 A

Type Classification:

Std MSR 05756032

Use:

The 81mm Sabot (Inert) is a training device for all 81mm Mortars.

Description:

The Sabot is designed to fire a 22mm sub-caliber practice cartridge M744, M745, M746 or M747 (Charges 1, 2, 3, or 4 respectively) as a training device in all model 81mm mortars. The Sabot with 22mm sub-caliber practice cartridges provides realistic mortar firing training at distances which correspond to range firing distances in the ratio of 1 to 10. The sub-caliber

device can be fired using standard mortar and sighting and fire control equipment and special firing table in the same manner as standard service mortar ammunition.

The aluminum body Sabot has the bore-reading dimensions and configuration of an 81mm mortar cartridge. It contains an insert 22mm barrel (not rifled) placed longitudinally to receive the 22mm sub-caliber cartridge which is loaded in the magazine just prior to firing. The shaft of the Sabot has stabilizer wings and guide pads to guide the Sabot as it travels up the mortar tube when fired. On firing the loaded Sabot is ejected from the mortar barrel and hits the ground within 1-5 yards (depending upon charge fired) in front of the mortar while the 22mm practice cartridge flies on to its target. The Sabot may be used as a dummy round when

not loaded with a 22mm practice cartridge. The Sabot is rugged and can be reloaded and fired again up to 1000 times for training purposes. It is stored (INERT) in a packing box containing 3 rounds.

22mm Sub-Caliber Practice Cartridge:

The cartridge consists of the projectile with stabilizer fins and cartridge case (divided chambers). The projectile has a steel body flattened at the tip. The wingshaft assembly, press-fit into the projectile body, contains the stabilizer fins (spring steel wrapped around the shaft) to stabilize flight. The wingshaft assembly also serves to seal the base of the projectile body. The projectile body contains the impact fuze and smoke signal charge. The propelling and ejection charges are contained in two separate chambers located in the jet-housing assembly, which is threaded into the base of the cartridge case. A flash tube hole between the chambers permits ignition of the propelling charge by the ejection charge. The cartridges are manufactured in a variety of four propellant charges. Each charge can be identified by notches on the jet screw assembly. One notch designates M744 (charge 1), two notches designate M745 (charge 2), etc.

Functioning:

The protective plastic cap covering the percussion cap of the sub-caliber cartridge must be removed prior to firing. When the practice round is loaded into the Sabot the device is ready for firing. When the Sabot with the sub-caliber cartridge is dropped into the mortar tube, the percussion cap strikes the firing pin of the mortar and is ignited. The percussion cap ignites the ejection charge in the jet housing assembly. The gasses emerge through the axial holes in the jet screw assembly initiating travel of the Sabot and sub-caliber cartridge up the mortar tube. Simultaneously the ejection charge ignites the sub-caliber projectile propelling charge, also contained in the jet housing assembly. This propels the sub-caliber projectile out of the cartridge case and through the barrel of the Sabot. As the Sabot leaves the muzzle of the mortar, the sub-caliber projectile clears the barrel of the Sabot. The Sabot impacts the ground within 1-5 yards (depending on charge fired) of the mortar tube, while the subcaliber projectile continues its flight down range.

CARTRIDGE, 81-MILLIMETER: TARGET PRACTICE, M43A1

Type Classification:

C&T AMCTC 6267 dtd 1968

Use:

This cartridge is used for target practice and contains a spotting charge for observation.

Description:

The complete round consists of a projectile body, a PD fuze, a fin assembly, a propellant charge, an ignition cartridge, and a percussion primer. The projectile body is of forged steel, and is threaded internally at the nose to accept the fuze and at the base to accept the fin assembly. The body is loaded with an inert plaster filler to simulate the weight

and ballistic characteristics of a high explosive cartridge. A pellet containing a spotting charge of black powder is loaded in a cavity just below the booster charge of the fuze.

Functioning:

When the cartridge is loaded, it slides down the mortar tube until the percussion primer in the ignition cartridge strikes the firing pin in the base cap of the mortar. The primer detonates the ignition cartridge, the cartridge ignites the propellant charge, and gases from the propellant charge expel the projectile and propel it to the target. The projectile is fin-stabilized in flight. The PD fuze functions on impact, detonating the fuze booster charge and the spotting charge.

Difference Among Models:

One series has a modified fuze in which the tetryl booster charge has been replaced with a black powder booster charge.

CARTRIDGE, 4.2-INCH: HE, M3A1 & M3

AR199464

AR199463

Type Classification:

OBS 11756003

Use:

This cartridge is used against personnel and materiel, providing both fragmentation and blast effect.

Description:

The complete round consists of a projectile body, a fuze, and a tail assembly. The steel body is designed to accommodate an impact, delay, or proximity fuze. A deep fuze well in the nose, is fitted with a supplementary charge of TNT. This charge is removed to accommodate certain

proximity fuzes. The tail assembly consists of a pressure plate and rotating disc, a propelling charge, a cartridge container and ignition cartridge, and a striker nut assembly.

Functioning:

When the cartridge is released, it slides down the mortar tube until the percussion primer strikes the firing pin. The flash from the primer ignites the ignition cartridge which, in turn, ignites the propelling-charge. The gases from the propelling charge exert pressure on the pressure plate at the base of the projectile which expands the rotating disc, engaging it in the rifling of the tube. The spin imparted to the projectile as it leaves the weapon stabilizes it in flight. The functioning of the fuze detonates the supplementary charge (when used) and the high explosive charge. Depending on

Change 8 4-55

the type of fuze used, the projectile bursts either over or on the target producing near optimum fragmentation and blast effect.

Difference between Models:

The fuze well on the M3 cartridge is designed to accommodate the burster tube of the M9 fuze. In addition, the physical dimensions of the two models are slightly different.

Tabulated Data:

Complete round:

Type ----- HE
Weight ----- 26.20 lb
Length ----- 23.05 in.
Cannon used with ----- M2, M30

Projectile:

Body material ----- Steel
Color ----- Olive drab w/yellow markings
Filler and weight ----- TNT, 7.80 lb
Supplementary charge ----- TNT, 0.365 lb

Components:

Ignition cartridge ----- M2*
Propelling charge ----- M6*
Fuze:
M3 ----- PD, M9
M3A1 ----- PD, M557, MTSQ,
M520 series, M564;
Prox. M513 series

CARTRIDGE, 90-MILLIMETER: HEAT, M371A1

AR199759

AR 199758

Type Classification:

Std. AMCTC 4265 dtd 1966

Use:

This cartridge is used in 90-mm recoilless rifles and is intended primarily for defeat of armor. There is also some limited effectiveness against fixed targets and personnel through blast and fragmentation.

Description:

The cartridge consists of an aluminum cartridge case and a steel projectile containing a

shaped charge of high explosive. A percussion primer with a black powder ignition cartridge is assembled to the base of the round. A rupture disk is held in place in the base of the cartridge case by the primer. The propelling charge is contained in a bag installed around the fin assembly which contains the primer ignition cartridge. The projectile has a stand-off spike, containing a piezoelectric element and a paper insulating cup, which is threaded to the body. An internal copper cone shapes the charge. The point initiating, base detonating fuze is contained in an adapter threaded to the base. The adapter is threaded to the fin assembly. The fins provide in-flight stability.

Functioning:

The primer ignites the propelling charge when struck by the firing pin of the weapon. The burning propellant generates rapidly expanding gases to propel the projectile out of the barrel and to the required velocity. Recoil is minimized by blowout of the rupture disk and controlled pressure relief through apertures in the breechblock. The projectile is stabilized in flight by the tail fins. On impact, crushing of the piezoelectric unit triggers the fuze. The standoff spike provides the optimum distance from the target surface for explosion of the shaped charge. The detonation collapses the copper cone and creates a focussed, high velocity shock wave. The intensity of the shock wave causes failure of the target armor, and a jet of metal particles penetrates the interior.

Tabulated Data:

Complete round:

Type -----HEAT
 Weight with fuze----9.25 lbs.

CARTRIDGE, 90-MILLIMETER: PRACTICE, M371

AR 199757

AR199756

Type Classification:

Std OTCM 37136 dtd 1959

Use:

This cartridge is used to train personnel armed with the 90-mm recoilless rifles in handling and use of HEAT rounds.

Description:

The cartridge resembles 90-mm HEAT round M371A1 and has similar ballistic characteristics, except that the high explosive filler is replaced with inert material of the same weight. A standoff spike with piezoelectric element in the nose cap is threaded to the nose of the projectile, and an adapter and fin are threaded to the base. The point initiating, base detonating fuze is housed in the adapter and a

smoke pellet is installed immediately ahead of the fuze. A copper cone in the projectile shapes the inert filler to maintain a ballistic match with the service round. The bagged propellant in the cartridge case surrounds the fin. The base of the cartridge case holds a percussion primer and a rupture disk. The black powder ignition charge of the primer is contained within the fin.

Functioning:

When the firing pin of the weapon strikes the primer, it ignites the propelling charge. The burning propellant generates rapidly expanding gases to propel the projectile out of the barrel and to the target. The fin stabilizes the projectile in flight. On impact, distortion of the piezoelectric element induces an electric current to function the PIBD fuze and ignite the smoke pellet for marking.

CARTRIDGE, 106 MILLIMETER: HEAT, M344A1 AND M344

AR199753

AR199752

Type Classification:

Std OTCM 3711959, dtd 1958

Use:

This cartridge is used in 106mm recoilless rifles against armored targets.

Description:

The cartridge consists of a perforated, plastic-lined steel cartridge case crimped to a steel projectile containing a shaped charge. The nose cone adapter of the projectile carries a cap with a piezoelectric element to initiate the PIBD fuze in the base. A copper cone within the projectile shapes the charge. The hollow

space within the cone and the adapter provides the appropriate standoff distance between target and shaped charge. An aluminum chamber threaded to the base of the projectile supports the fuze, six folding fins, and a piston assembly for opening the fins. The cartridge case is loosely filled with propellant, and the base is fitted with a percussion primer. The ignition tube of the primer extends through the propelling charge.

Functioning:

The primer ignites the propelling charge when struck by the firing pin. The burning propellant generates rapidly expanding gases to propel the projectile through the barrel and to the target. Recoil is eliminated by controlled

escape of propellant gases to the rear through openings in the breechblock. Gas pressure also builds up in the piston in the projectile base. When the projectile leaves the muzzle, the piston moves rearward to extend the fins for stability in flight. On impact, distortion of the piezoelectric element generates an electrical charge and initiates fuze functioning to detonate the projectile. Explosion of the shaped charge collapses the copper cone and focuses a high velocity shock wave and a jet of metal particles that penetrates the target.

Difference Between Models:

M344 has a propelling charge of 8.1 lb M10, and the design of the projectile charge-shaping cone is different from M344A1.

Tabulated Data:

CARTRIDGE, 40-MILLIMETER: HE, M381

AR199575

AR199576

Type Classification:

Std AMCTC 9392 dtd 1972

Use:

This cartridge is a high explosive round designed to inflict personnel casualties from ground burst effect, and is fired from 40-mm Grenade Launcher M79 or the M203 (attached to the M16/M16A1 rifle).

Description:

The cartridge is a fixed round of ammunition consisting of a projectile assembly and a cartridge case assembly. The projectile has a hollow, one-piece aluminum body containing rotating bands. A hollow aluminum ogive is fitted

to the front end of the projectile. A hollow steel ball assembly containing the bursting charge is fitted into the rear of the projectile body. A booster charge with a PD fuze is threaded into a well in the forward side of the ball. The projectile assembly is press-fitted into a cartridge case. The case is a hollow, aluminum bichambered cylinder with a smaller inner chamber. A cup fitted into the cartridge base. The cup contains the propelling charge with a percussion primer in the center. The cup acts as a high-pressure chamber and the hollow cavity in the case, which surrounds the cup, acts as a low-pressure chamber. The fuze contains an inertial ring operating through push pins and levers upon a detonator.

Functioning:

The weapon firing pin strikes the percussion primer igniting the propelling charge in the high-pressure chamber. The burning propelling charge generates sufficient pressure to rupture the propellant cup forcing the expanding gases through vent holes into the low-pressure chamber. The rotating band around the projectile engages the rifling in the launcher tube to impart spin of 3600 RPM to the projectile. The pressure created by the expanding propellant gases in the low-pressure chamber forces the projectile through the launcher barrel with a muzzle velocity of 76 meters per second (250 fps). Setback force from firing causes the firing pin in the fuze to be withdrawn from the rotor ball detent, and centrifugal force from projectile rotation causes the rotor ball assembly to align the detonator with the explosive train. The fuze arms after the projectile has traveled approximately 2.4 to 3 meters (8 feet) from the launcher. Upon graze or impact with the target, inertia causes the inertial ring to act on the push pins, pivoting the levers inward to force the firing pin into the detonator. The detonator ignites the booster charge, and the booster detonates the explosive charge, producing blast and fragmentation of the projectile body.

CHARGE, PROPELLING, 155-MILLIMETER: M3 SERIES

Type Classification:

M3A1: Std AMCTC 4633 dtd 1966

M3: Std AMCTC 4633 dtd 1966

Use:

The M3 series propelling charges are green bag type designed for use in 155-mm howitzers for firing in Zones 1 through 5.

Description:

The full charge consists of approximately 5.50 pounds of propellant including a base charge and four unequal increments loaded in cloth bags. The bags are fastened together with four cloth straps sewn to the base and tied on top of Increment 5. Charge M3 is assembled

without flash reducer pads. Charge M3A1 includes 3 flash reducer pads containing potassium nitrate or potassium sulphate. A 2 ounce pad is assembled forward of the base charge and there are two 1-ounce pads forward of Increments 4 and 5. The igniter charge of the M3A1 is 3.5 ounces of clean burning igniter (CBI) in a red cloth bag sewn to the rear of the base section. The igniter charge of the M3 is 3 ounces of black powder. The seams of the base charge section are inverted on the M3A1 only so that the edges of the cloth are inside to reduce residue after firing.

Functioning:

The primer ignites the igniter pad, and the igniter charge, in turn, ignites the propellant

charge. The burning propellant generates rapidly expanding gases to propel the projectile through the barrel and to the velocity required to reach the target or function point. The flash reducer pads serve to limit breech flare-back as well as muzzle flash and blast overpressure.

Difference Between Models:

Model M3 does not include flash reducers. The igniter charge is 3 ounces of black powder instead of CBI, and the base seams are not inverted.

TM 9-2350-217-10N

CHARGE, PROPELLING, 4.2-INCH: M6

Use:

This charge is a component of Smoke Cartridges M2 and M2A1, Gas Cartridges M2 and M2A1, and High Explosive Cartridges M3 and M3A1.

Description:

A full charge consists of 25-1/2 increments of M8 sheet propellant arranged in the following order: one 1/2 increment, four 5 increment bundles, and five single increments. This full charge is assembled on the cartridge as issued. Individual increments or bundles may be removed as required for fire adjustment as indicated in the appropriate firing tables. The method of securing the increments to the cartridge container varies among the cartridges, but each method involves the use of a wire propellant holder in front of or behind the increments.

Functioning:

The flash from the detonation of Ignition Cartridge M2 passes through the vents in the cartridge container, providing direct ignition of the propelling charge.

Tabulated Data:

Type propellant -----M8
 Weight (full charge) ---0.60 lb.
 Used with ignition
 cartridge----- M2
 Drawing number -----71-12-27

Limitations:

To avoid excessive pressure which could result in damage to materiel and injury to personnel, charges must be fired at or above the following temperatures:

23-25-1/2 increments --- +60°F
 20-22-1/2 increments --- +20°F
 17-19-1/2 increments --- 0°F
 5-16-1/2 increments --- -40°F
 when using Cartridges M2, M2A1, M3, M3A1, M328, M329B1 and M335 assembled without cartridge container extensions.

CHARGE, PROPELLING, 3-INCH: M1

AR199700

Type Classification:

Std OTCM 36841 dtd 1958

Use:

used for zone firing with Charges 1 to 5 in 8-inch howitzer cannons.

Description:

The charge consists of a base section (Charge 1) and four unequal increments (2 through 5) of propellant M1 in green cloth bags. The increments are assembled end to end in

sequence, and held in place by four tying straps sewn to the base of Increment 1 and tied over the top of Increment 5. A red igniter pad containing 5 ounces of black powder is sewn to the base of Increment 1. Each increment of the charge and the igniter pad is identified by black

Functioning:

The flash from the primer ignites the black powder igniter pad, which in turn ignites the M propellant in the charge. The burning propellant generates gases which force the projectile out of the gun tube at a velocity required to reach the target.

GRENADES**

This copy is a reprint which includes current
pages from Changes 1 through 5.

HEADQUARTERS, DEPARTMENT OF THE ARMY

OCTOBER 1977

GRENADE, HAND: FRAGMENTATION, IMPACT M26A2

TYPE CLASSIFICATION:

Std. LCC-B, OTCM 37544.

Use:

The M26A2 impact fragmentation hand grenade is used to supplement small arms fire against the enemy in close combat. The grenade produces casualties by high velocity projection of fragments.

Description:

a. Hand grenade M26A2 is assembled with an electrical impact fuze M217 which incorporates a secondary pyrotechnic delay feature which detonates the grenade if it fails to detonate upon impact. The body of the grenade is constructed of two pieces of thinwall sheet steel, has a notched fragmentation coil liner. Bodies contain a high explosive filler.

b. Fuze M217 is equipped with a safety pin, the split end of which is either spread or has a diamond crimp, and a pull ring. IMPACT is embossed on the safety lever. (Older models had red safety levers with or without IMPACT painted thereon in black.) The major components are as follows: a bouchon assembly, a fuze body assembly (which contains a thermal power supply, an arming delay thermal switch, a delay-detonation terminal switch assembly, an impact switch assembly and an electric detonator), and a booster pellet. The bouchon assembly consists of a striker, striker spring, a striker hinge pin, safety lever and safety pin with pull ring. The fuze body is hermetically sealed.

Shipping and Storage Data:

Quantity distance

Class-----7

Storage compati-

bility group-----E and G

DOT shipping

Class-----A

DOT designation---Hand Grenade

Functioning:

Removal of safety pin permits release of the safety lever. When the grenade is thrown, the striker assembly, through action of the striker spring, throws off the safety lever and impacts the percussion primer. The primer initiates the power supply, which causes the fuze to arm within one to two seconds; thereafter, the grenade is subject to detonation upon impact.

NOTE

At high temperature (+125°F), arming time may be as short as 1 second; at low temperature (-40°F), as long as 2 seconds. The secondary pyrotechnic delay feature functions within 3 to 7 seconds throughout the temperature range of -40°F to +125°F.

If the grenade does not detonate on impact (after proper arming time), the grenade will be detonated by the secondary pyrotechnic delay feature. If the fuze fails to function after release of the safety lever, the fuze power supply will become inactive within 30 seconds.

FM 23-30

Remarks:

The M26A2 is the same as the M57 but without a safety clip.

The bodies of the M26, M26A1, and M61 contain booster pellets and are longer and narrower than those of the M26A2 and M57.

The bodies of the M26A2 and M57 do not contain booster pellets.

The M56 was the M26A2 with fuze M215.

The body of the M26A2 (M57 without a safety clip) is identical with the M61, M26A1, and M26, except the fuze thread is different.

GRENADE, HAND, SMOKE, HC, AN-M8

AR 101027

TYPE CLASSIFICATION:

Std. LCC-A, MSR 3408.

Use:

The HC Smoke Hand Grenade AN-M8 is a burning type grenade used to generate white smoke for screening activities of small units. It is also used for ground-to-air signaling.

Description:

a. The grenade body is a cylinder of thin sheet metal. It is filled with HC smoke mixture topped with a starter mixture directly under the fuze opening. The duration of smoke screen or signal is 105 to 150 seconds.

b. Hand grenade fuze M201A1 is a pyrotechnic delay-igniting fuze. The body contains a primer, first-fire mixture, pyrotechnic delay column, and ignition mixture. Assembled to the body are a striker, striker spring, safety lever and safety pin with pull ring. The split end of the safety pin has an angular spread.

c. Safety clips are not required with these grenades.

TABULATED DATA:Grenade (with fuze):

Model(s)-----AN-M8
 Body-----Sheet metal
 Weight-----2 1/2 oz
 Length-----5.7 in.
 Diameter-----2.5 in.
 Color-----Light green w/black markings

Packing-----1 per container; 16 per
 packing box

Filler:

Type-----HC (type C)
 Weight-----19 oz

Fuze:

Model(s)-----M201A1
 Type-----Pyrotechnic delay-ignit-
 ing
 Primer-----M39A1
 Ignition mixture----Iron oxide, titanium,
 zirconium
 Delay time-----0.7-2 sec
 Weight-----1.5 oz
 Length-----3.9 in.
 Color (safety
 lever)-----Gray or olive drab w/
 black markings
 Packing-----Not separately issued
 Safety device-----Pull ring and safety pin

Federal Supply Code:

 Grenades Packed - 1 per container; 16 per
 packing box

Packing Data:

Packing box:

Weight (with contents)-----41.0 lb
 Dimensions-----14.0" X 14.0"
 X 8.0"
 Cube-----0.90 cu ft

Shipping and Storage Data:

Quantity distance
 Class-----2
 Storage compati-
 bility group-----A
 DOT shipping
 Class-----C
 DOT designation---Smoke Grenades
 Handle Carefully
 Keep Fire Away

Functioning:

Removal of the safety pin permits release of the safety lever. When the safety lever is released, it is forced away from the grenade body by a striker acting under the force of a striker spring. The striker rotates on its own axis and strikes the percussion primer. The primer initiates the first fire mixture. The fuze delay element, ignition mixture, and grenade starter mixture and filler are initiated in turn by the preceding component. The pressure sensitive tape is blown off the emission holes and smoke is emitted for 105 to 150 seconds.

GRENADE, RIFLE: SMOKE, WP, M19A1

TYPE CLASSIFICATION: Std. CON MSR 6558

Use:

For screening, signaling, or for incendiary effect against flammable targets.

Description:

a. WP smoke rifle grenade M19A1 is filled with WP. This chemical agent ignites spontaneously when exposed to air, producing a yellow-white flame and giving off a dense cloud of white smoke. When used as an anti-personnel weapon, grenade M19A1 has an effective casualty radius of 10 meters. Grenade M19A1 has a maximum range of approximately 195 meters.

b. WP smoke rifle grenade M19A1 consists of three basic parts: a steel stabilizer tube assembly, an integral fuze and a body.

TABULATED DATA:

Model-----M19A1
Type-----Smoke (WP)
Weight-----1.5 lb
Dimensions:
Diameter-----2.0 in.
Height-----11.31 in.
Charge (WP)-----8.5 oz
Body-----Sheet steel

Fuze:

Type-----Mechanical impact
detonating

Color-----Light green w/yellow
band; red marking
Packing-----1 per container;
10 containers per
packing box

Federal Supply Code:

NSN-----1330-00-542-0715

See SC for complete packing data
including NSN's pertaining to
DODAC

Unit of Issue:

Each
Grenades Packed: 1 per container;
10 containers per packing box

Packing Data:

Loaded packing box:
Weight 40.9 lb
Dimensions-----19.75 in.x
7.875 in.x
16.75 in.
Cube-----1.51 cu ft

Shipping and Storage Data:

Quantity distance class--3
Storage compatibility
group-----A
DOT shipping class-----A
DOT designation-----Rifle Gren-
ades

Functioning:

After the grenade is launched, the fuze functions on impact. It bursts the body and scatters particles of burning WP over a large area. Grenade and fuze function as follows:

- a. The grenade ogive strikes the ground or other resistant object.
- b. Inertia of the firing pin overcomes spring tension and the firing pin strikes the primer.
- c. The primer emits a small, intense spit of flame.
- d. Flame from the primer explodes the detonator.
- e. Explosion of the detonator ruptures the body. Fragments of the body and particles of WP scatter over an area with a radius of approximately 10 meters.
- f. Particles of WP ignite upon coming into contact with air and produce a dense cloud of white smoke.

LAND MINES

(FSC 1345)

This copy is a reprint which includes current pages from Changes 1 through 5.

HEADQUARTERS, DEPARTMENT OF THE ARMY

FEBRUARY 1977

MINE, ANTITANK: HE, HEAVY, M15

**Type Classification: S 37119 (LCC-A)**

a. Use. Antitank mine M15 is intended for use against heavy tanks and other types of heavy tracked and wheeled vehicles.

b. Description. The mine is a flat, steel cylinder with the fuze and most of the other components located concentrically with the vertical axis. Two secondary fuzing wells, threaded to accept M1 activators, are located, one in the side and one in the bottom, to provide for alternate fuzing and booby trapping arrangements. The mine, as shipped, has these wells covered with tape. The recessed knob in the M4 arming plug, located top, center, carries an arrow, and may be set to indicate Safe, Danger, or Armed, as indicated on the rim of the plug. A carrying handle, attached to the underside of the mine, is provided. The mine body houses the arming plug, pressure plate, multiple element belleville spring primary fuze, M120

booster, and main explosive charge. The mine is shipped with fuze not assembled, with the fuze packed separately in a metal can in the packing box. Arming of the mine requires the use of the M20 wrench, with which the arming plug is unscrewed, permitting insertion of the fuze. Following removal of the safety fork, the fuze is inserted in the well. After verifying that the setting knob and shutter are in the safe position, the arming plug is screwed into place and wrenched tight. The mine is armed by rotating the setting knob to the Armed position with the M20 wrench.

c. Functioning. When the shutter of the arming plug is in the Armed position, a force of 350 to 750 pounds on the pressure plate of the mine will allow the load to be transferred to the fuze. This force activates the fuze mechanism, driving the firing pin into the detonator. This initiates the M120

booster in the bottom of the fuze well, which, in turn, detonates the main charge.

d. Tabulated Data.

LIFE CYCLE ENVIRONMENTAL ASSESSMENT
PROJECT NUMBER 1-82-09-7797

TITLE: CARTRIDGE, 81MM, HE, M821E1
CARTRIDGE, 81MM, HE, M889E1

1. Purpose and Need for Proposed Action - The 81mm M821E1/M889E1 HE Crgs are Americanized versions of the United Kingdom's (UK) M821/M889 HE Crgs. The M821E1/M889E1 will retain the range, accuracy and Lethality of the UK 81mm M821/M889 while utilizing a less expensive method of manufacturing and facilitization. The M821E1/M889E1 are required in order to have on shore capability to produce an I-81mm HE round that meets safety and performance standards of the UK 81mm cartridges. The M821E1/M889E1 rounds will eventually replace the UK 81mm rounds.

2. General Description of Proposed Action - The project involves development of an Americanized 81mm HE Cartridge for firing from the 81mm mortars which will retain the range, accuracy and lethality of the UK M821 HE Rounds.

a. The M821E1/M889E1 Cartridges are composed of the following material:

1. Body, HFI Normalized steel
2. M24 Fin assembly: Aluminum Alloy
3. Obturator; Polycarbonate per ASTM D3935-80
4. Fuzes (M734/M935):

a) Multi-Option Fuze, M734 - This fuze provides four (4) fuze functions (Proximity airburst, near-surface burst, electromechanical impact, and mechanical delay after impact). It utilizes a ram air turbine/alternator to provide fuze electrical power and mechanical energy to arm the fuze after a minimum safe travel distance. The M734 fuze is constructed primarily of plastic and aluminum. The explosive elements contained in the fuze are minute compared to the cartridge and any impact on the environment from these elements is minimal. Any fragments resulting from the explosion of the fuze has no significant impact on the environment (Ref. Life Cycle Environmental Assessment Improved 81mm Mortar System, Cartridge, 81mm, HE, M821/Cartridge, 81mm, HE, M889).

b) Point - Detonating Fuze, M935: The M935 Point-Detonating fuze is a selective, super-quick or 0.5 second delay action impact type fuze for use with M888 60mm mortar cartridge and M889 81mm mortar cartridge. The fuze is primarily constructed of aluminum with some internal parts made of zinc.

The front body assembly contains an arming mechanism and a firing mechanism which includes two spring-loaded set back pins, a slider with inner and outer compression springs, an arming pin, and two balls which restrain the super-quick firing pin and a pyrotechnic, delayed arming striker sequence.

LIFE CYCLE ENVIRONMENTAL ASSESSMENT

PROJECT NUMBER: 1X464601AD227

TITLE: IMPROVED 81MM MORTAR SYSTEM, M252

1. Purpose and Need for Proposed Action - The Improved 81mm Mortar will provide the organic indirect fire support needed by the Infantry maneuver battalion. It will satisfy a need to improve the performance and effectiveness of the current 81mm Mortar System, and to provide improvements in the area of range, stability, fire control and ammunition lethality.

The United Kingdom's 81mm Mortar System (US designated M252) was chosen to provide improved performance and effectiveness as well as improved interoperability. The improved mortar system will provide significant increases in operational capabilities thus allowing the replacement of current mortars in some infantry units.

2. General Description of Proposed Action - The project includes the transfer of technology of a mortar system from the UK, (the improvement of the product) Improvement 81mm Mortar System (I-81), capable of meeting the Required Operational Capability (ROC) of increased range, improved performance and effectiveness as well as improved interoperability with our NATO allies. The UK produces the I-81mm Mortar System for the US as well as for themselves and other countries under UK environmental regulations. Therefore, the US environmental regulations do not apply.

a. M252 Mortar System - The M252 Mortar (UK designated L16A2) consists of the following:

(1) Cannon, M253 - The M253 Cannon is a smooth-bore, forged, hollow steel barrel providing 32.83 inches of projectile travel.

(2) Mount, M177 - The M177 Bipod is a conventional bipod mortar Mount made of light alloy steel providing necessary elevation, azimuth and cross leveling adjustments.

(3) Baseplate, M3 - The M3 Baseplate is an existing, US (International Manufacturing Corporation) produced item consisting of a one piece aluminum forging and is currently used on the existing M29 and M29A1 Mortar. An improved, high strength version of this baseplate designated M3A1, will replace the basic M3 by attrition. This item is used only for anchoring the weapon and does not produce any fragments or other waste when the weapon is fired.

(4) Sight Unit, M64A1 - The M64A1 Sight is an existing US design produced by Ernst Leitz of Canada. There is a panoramic telescope incorporating deflection and elevation features. The dials and reticles are self-illuminating, utilizing tritium. This sight is also used on the 60mm M224 Light Weight Company Mortar System.

(5) Propellant Container - The container is a US produced item manufactured by Armtec, Inc., Coachella, CA.

b. Ammunition - The M252 Mortar System includes the following high-explosive (HE) ammunition:

(1) Cartridge, 81mm, HE M821 (UK designated XL31E2) - This cartridge is produced by Royal Ordnance in the United Kingdom except for the US produced M734 Multi-Option Fuze and M223 propellant increment container. The M734 Fuze has been produced in the US by Kodak, Inc., Rochester, NY for use on the 60mm M720 HE Cartridge, Light Weight Company Mortar System (LWCMS).

(2) Cartridge, 81mm, HE, M889 - This round is identical to the M821 except for use of the M935 PD Fuze instead of the M734. The M935 Fuze has been produced in the US by Bulova Corporation for use on the 60mm M888 HE Cartridge.

(3) Multi-Option Fuze, M734 - This fuze provides four (4) fuze functions (proximity airburst, near-surface burst, electromechanical impact, and mechanical delay after impact). It utilizes a ram air turbine/alternator to provide fuze electrical power and mechanical energy to arm the fuze after a minimum safe travel distance. The M734 fuze is constructed primarily of plastic and aluminum. The explosive elements contained in the fuze are minute compared to the cartridge and any impact on the environment from these elements is minimal. Any fragments resulting from the explosion of the fuze has no significant impact on the environment.

(4) Point - Detonating Fuze, M935: The M935 Point-Detonating fuze is a selective, super-quick or 0.5 second delay action impact type fuze for use with M888 60mm mortar cartridge and M889 81mm mortar cartridge. The fuze is primarily constructed of aluminum with some internal parts made of zinc.

The front body assembly contains an arming mechanism and a firing mechanism which includes two spring-loaded set back pins, a slider with inner and outer compression springs, an arming pin, and two balls which restrain the super-quick firing pin and a pyrotechnic, delayed arming striker sequence.

The explosive train consists of a delay detonator and a super-quick detonator housed 90° apart in the cylinder slider, a lead assembly and a booster charge. The explosive elements contained in the fuze are minute compared to the cartridge and any impact on the environment from these elements is minimal. Any fragments resulting from the explosion of the fuze have no significant impact on the environment.

3. Alternative Considered

The design and development of a new 81mm Mortar System, including the product improvement of the existing US M374A3 High Explosive Cartridge, to meet the ROC were considered. The selection of the UK system was based upon the highly motivated Rationalization, Standardization, and Interoperability (RSI), movement and the associated bilateral agreements to utilize available systems from other countries rather than to develop a similar system.

FINDINGS OF NO SIGNIFICANT IMPACT

Project Number: 1X464601AD227

Title: Improved 81mm Mortar System

1. Name of Action: To field the I81mm Mortar System for the US Marine Corp (June 88) and for the US Army (Sept 88).

2. Description of action: The M252 Mortar System is the transfer of technology and the development with the United Kingdom of an Improved 81mm Mortar System which meets the Required Operational Capability of increased range (over the current system), improved performance and effectiveness as well as interoperability with our NATO allies. It is considered the best alternative because it utilizes an available system from another country rather than developing a similar system.

3. Discussion of the Anticipated Environmental Effects: The anticipated environmental effects resulting from this weapon system will be minor and temporary in nature. All firing will be conducted in compliance with applicable laws and regulations of the military bases and in areas specifically dedicated to this type of weapon deployment. The primary sources of pollution are the propellant, explosive, and chemical reaction products that are produced from firing the mortar cartridges. However, these emissions are of short duration and will not produce any significant or permanent impact on the quality of air, water, or soil. Since this weapon will be fired in controlled remote areas, there will be no significant impact on the flora and fauna or any adverse impact on any archeological or historical sites.

4. Conclusions: The manufacturing, loading, and testing of the Improved 81mm Mortar System will not significantly impact the environment of using installations. Therefore, it has been determined that this program:

- a. Is not a major federal action significantly affecting the quality of the human environment.
- b. Will not have a significant impact on the environment.
- c. Is not likely to be environmentally controversial.
- d. Will not likely result in litigation based on environmental quality issues.
- e. Does not require any other environmental impact statement.

LIFE CYCLE ENVIRONMENTAL ASSESSMENT

PROJECT NO. 1W464601D22700

TITLE: CARTRIDGE, 81MM:ILLUMINATING, M853A1

A. PURPOSE AND NEED FOR PROPOSED ACTION.

This environmental assessment involves the development of the M853A1 Illuminating Cartridge for use in the M252 81mm Mortar System. This munition was designed to provide significantly improved illumination effects and will be a replacement for the currently fielded M301A3 Illuminating Cartridge. The M853A1 Cartridge has the capability to provide sufficient illumination to permit adjustment of fire and to observe out to the maximum range of the M821 HE Cartridge.

B. GENERAL DESCRIPTION OF PROPOSED ACTION.

1. GENERAL CHARACTERISTICS: The design of the M853A1 Illuminating Cartridge is based on the use of a cylindrical cargo configuration to attain adequate payload capacity with maximization on the ballistic range capability. The M853A1 Cartridge is comprised of a thick-walled aluminum body tube which contains the payload (parachute and illuminating candle), an aluminum tail cone, aluminum tail fin assembly, obturating ring, and the same M772 MTSQ Fuze used on the M819 RP Smoke Cartridge. The payload is base ejected and, upon deployment of the illuminating candle, produces 525,000 candlepower and burns for 50 seconds minimum.
2. FUNCTIONING CHARACTERISTICS: In use, the M853A1 Cartridge is dropped into the mortar tube, fin end first. The Federal 150 Primer in the M752A1 Ignition Cartridge functions on striking the firing pin in the base of the mortar. The fired primer ignites a black powder pellet which flashes through holes in the flash tube to initiate the M9 Propellant Charge. The burning M9 Propellant flashes through flash holes in the boom of the M29 Fin igniting the M219 Propelling Charge increments containing M38 Propellant. The resulting gas pressure forces the projectile out of the mortar tube. During ballistic flight, the M772 Fuze functions and initiates a detonator which ignites the black powder expelling charge. The payload is base ejected and, upon deployment, the burning candle produces illumination.

FINDING OF NO SIGNIFICANT IMPACT

Object Number: 1W464601D22700

Title: Cartridge, 81mm: Illuminating, M853A1

1. Name of Action:

The 81mm M853A1 Illuminating Cartridge is an improved illuminating munition.

2. Brief Discussion of the Action:

This munition was designed to provide significantly improved illuminating effects and will be a replacement for the currently fielded M301A3 Illuminating Cartridge. The M853A1 Cartridge has the capability to provide sufficient illumination to permit adjustment of fire and to observe out to the maximum range of the M821 HE Cartridge.

3. Discussion of Anticipated Environmental Effects:

- a. The combustion products produced by firing the 81mm M853A1 Illuminating Cartridge are considered of low toxicity. These products will have a minimal effect on water and land quality as a result of potential migration.
- b. Air pollution will be limited to that derived from functioning of the munition. This is of a transient nature. The gaseous emissions dissipate rapidly in the open air.
- c. Solid wastes include steel and aluminum metal parts which have a negligible impact on the environment.
- d. Initial Production Testing will be conducted at Dugway Proving Ground. Test firings will be conducted on approved test sites in compliance with federal, state and local environmental laws and regulations.
- e. Dugway Proving Ground is an established TECOM test facility with compatible use noise zones. Therefore, noise levels will comply with environmental regulations.
- f. Manufacture and assembly of the M853A1 Illuminating Cartridge will be conducted at approved government owned facilities. Control of production wastes, emissions and effluents will be accomplished under applicable federal, state and local environmental laws and regulations and consequently there will be no adverse environmental effects.

4. Conclusions:

The manufacturing, loading, and testing of the M853A1 Illuminating Cartridge will not significantly impact the environment of using installations. The determinations on this program are as follows:

- a. Is not an action significantly affecting the quality of the human environment.
- b. Will not have a significant impact on the environment.
- c. Is not likely to be environmentally controversial.
- d. Does not require an environmental impact statement.

5. Point of Contact for Public Comments:

LIFE CYCLE ENVIRONMENTAL ASSESSMENT
PROJECT NO. 6468 D250

TITLE; CARTRIDGE, 81MM, PRACTICE M879

1. Purpose of Needs for Proposed Action:

The M879 Training/Practice (T/P) Cartridge is a low cost round which will provide full range capability for infantry training. It will satisfy a need for a training round which provides a visual and audible effect upon impact of sufficient magnitude to permit the forward observer to make fire adjustments under all climatic conditions anticipated for its use. It also provides realistic ammunition handling for the mortar crew.

2. General Description of Proposed Action:

The project involves development of an 81mm Training Cartridge. The program is in accordance with the Training Device Requirements (TDR) cards of No. 0252. This cartridge is being developed to replace the existing high explosive rounds used for training. The M879 will be more cost efficient and safer than the HE cartridges.

A. The M879 T/P Cartridge is non-fragmenting and disposable. It is currently composed of the following materials:

1. Body; 1340 Steel Forging (ASTMA322).
2. M24 Fin Assembly; Aluminum Alloy 7075-T6 (ASTM-B221).
3. Obturator; Polycarbonate (ASTM D3935-80).
4. M751 Fuze; Aluminum Alloy (ASTM B85, Alloy SC84B).
5. M299 Ignition Cartridge; Aluminum Alloy 2024-T4 (ASTM-B211).
6. Fiber Propellant Container; Kraft Fiber, Spec MIL-C-50269 and nitrocellulose, Grade A, Type I, Spec MIL-N-244.
7. 20 gauge Pyrotechnic Fuze Signature Charge: Polyethylene and Low Carbon Steel (AISI 1018).

B. The firing of an M879 T/P Cartridge at maximum charge results in the initiation of three (3) separate chemical reactions, i. e.,

1. The primary ignition system; M299 Ignition Cartridge
2. The secondary propulsion system; 4 ea M220 Propelling Charges
3. The Pyrotechnic Fuze Signature Charge.

FINDING OF NO SIGNIFICANT IMPACT

Project Number : 6468 D250

TITLE: Cartridge, 81mm, Practice M879

1. Name of Action:

M879, 81mm, Full-Range Training Rounds to be used for realistic training of mortar crews and forward observers.

2. A Brief Description of the Action:

a. The M879, 81mm Training Round will provide a visual and audible effect upon impact to permit forward observers to make fire adjustment under all climatic conditions, as well as provide realistic ammunition handling techniques for the crew.

b. Alternatives Considered:

The 81mm high explosive (HE) rounds which are currently used for troop training incurs an economic and safety burden on the user. The M879 full range training cartridge will replace the HE cartridge and will provide realistic training. The M879 does not incorporate the HE fill and costs approximately 58% less than the HE cartridge. The training cartridge will also reduce the environmental impacts experienced by the HE cartridges by reducing the overall emissions. For the HE life cycle analysis see documents - Ctg, 81mm, HE M821E1, Ctg, 81mm, HE, M889E1, Improved 81mm Mortar System.

3. Discussion of Anticipated Environmental Effects:

a. The reaction products produced by firing the M879 Cartridge are considered of low toxicity. (See Paragraph 2B)

b. Since test firings have been conducted at APG, TECOM facilities are buffered and the noise level will comply with environmental regulations.

c. The manufacture and assembly of M879 Cartridges is accomplished in accordance with applicable federal, state and local environmental laws and regulations, and consequently there will be no adverse environmental effect.

4. Conclusions which led to the FNSI:

a. The manufacture and assembly of training rounds will be done by an approved load/assemble/pack (LAP) facility, MILAN. This work will be done under applicable federal, state and local environmental laws and regulations and consequently will not adversely impact the environment.

b. The M879 Training Cartridge will be deployed to Army Camps and Bases in the USA. For European use, a training round with only a white smoke signature is required due to ranges being of limited size, many of which are bordered by private homes.

c. The M879, 81mm Training Round is a non-fragmenting and disposable projectile. It has been determined that the use of the M879 Full-Range Training Round:

(1) Is not a major federal action significantly affecting the quality of the human environment.

(2) Will not have a significant impact on the environment.

(3) Is not likely to be environmentally controversial.

(4) Does not require an environmental impact statement.

5. Point of Contact and deadline for receipt of public comment:

(a) Department of the Army
Commander, ARDEC
ATTN: AMCPM-MO, (Mr. S. Pinkard)
Picatinny Arsenal, NJ 07806-5000

(b) Deadlines for receipt of public comment is 30 days after completion of Findings of No Significant Impact (FNSI).

RECORD OF ENVIRONMENTAL CONSIDERATIONS

PROJECT NUMBER: 2-MU-001-880-001

TITLE: CARTRIDGE, 81MM. PRACTICE, M880 WITH REFURBISHMENT KITS

FIRE SUPPORT ARMAMENTS CENTER

DATE: 16 June 1992

Description of Proposed Action: This project involved the development of an 81mm practice cartridge. The program is in accordance with the training device requirement(TDR). This cartridge was developed to replace the existing high explosive rounds used for training. The M880 will be more cost efficient and safer than the high explosive cartridges.

Anticipated Date and/or Duration of Proposed Action: 1 July 1992

It has been determined that the action (choose one):

a. Is adequately covered in the existing EA X EIA EIS
entitled: Life Cycle Environmental Assessment, Cartridge, 81mm, Practice, M879
and dated: 15 November 1988

(Provide copy of cited document to Commander EQC, if available)

b. Qualified for categorical Exclusion# , Appendix A, AR 200-2, and no extraordinary circumstances exist as defined in Paragraph 4-3, AR 200-2.
(Include Environmental Quality Consideration evaluation).

c. Is exempt from NEPA requirements under the provisions of (cite superseding law):

ENVIRONMENTAL QUALITY CONSIDERATIONS

PROJECT: NUMBER: 2-MU-001-880-001

TITLE: Cartridge, 81mm, Practice, M880 with Refurbishment Kits

Proponent: Mark J. Zhelesnik

DATE: 16 June 1992

1. Concise Description of the proposed project:

The M880 Practice Cartridge is a low cost round which will provide 1/10 range capability for infantry training. It will satisfy a need for a training round which provides a visual and audible effect upon impact of sufficient magnitude to permit the forward observer to make fire adjustments under all climatic conditions anticipated for its use. It also provides realistic ammunition handling for the mortar crew.

The M880 Practice Cartridge is composed of the following materials:

1. Body; cast Iron, (hollow)
2. Tail Fin; Aluminum Alloy
3. Obturator; molded plastic
4. M775 Fuze; Aluminum Alloy, 20 gauge Pyrotechnic Fuze Signature Charge (12 grams)
5. M985 Ignition Cartridge (5.51 grams)
6. Increment Plugs, Polyethylene, high density

The M879 81MM Practice Cartridge (Full Range), upon which this Record of Environmental Considerations is based, is composed of the following materials:

1. Body; forged steel projectile filled with 60% white hydrocal gypsum cement, 40% water
2. Tail Fin; Aluminum Alloy
3. Obturator; molded plastic
4. M751 Fuze; Aluminum Alloy, 20 gauge Pyrotechnic Fuze Signature Charge (18 grams)
5. M299 Ignition Cartridge (6.8 grams)
6. Four M220 Increment Containers (155 grams)

The M879 has the same fuze composition but with a higher amount of energetic material, and the ignition system has a higher total energetic level than that of the M880 system. The M879 ignition system uses the M299 ignition cartridge plus four M220 increment containers while the M880 uses only a 12 gauge shot gun shell as the ignition system. The M879 is also a full range fire and forget cartridge which would remain as an environmental contaminant while the M880 is a 1/10 range recoverable cartridge which is refurbished and used again.

The firing of an M880/M879 cartridge at any charge results in the initiation of two separate chemical reactions, i.e.

1. The Ignition system
2. The Pyrotechnic Fuze Signature Charge

The chemical composition and reaction products for the M880 energetic components are as follows:

PYROTECHNIC FUZE SIGNATURE CHARGE

PYROTECHNIC COMPOSITION (SW592): TOTAL WEIGHT: 12grams/round

| | WEIGHT |
|-----------------------------|------------|
| Aluminum (36%) | 4.32 grams |
| Potassium Perchlorate (36%) | 4.32 |
| Zinc Dust (28%) | 3.36 |

REACTION PRODUCTS POSTULATED:

| | WEIGHT |
|--------------------------|------------|
| Aluminum Oxide (56%) | 8.14 grams |
| Potassium Chloride (29%) | 4.18 |
| Zinc Oxide (15%) | 2.33 |

IGNITION CARTRIDGE M985:

COMPOSITION (Double Base Propellant Charge, Weight: 5.51 grams/round)

| | WEIGHT |
|-------------------------------|------------|
| Nitrocellulose (57.12%) | 3.15 grams |
| Nitroglycerine (40.26%) | 2.22 |
| Ethyl Centralite (1.16%) | 0.06 |
| Potassium Sulfate (1.26%) | 0.069 |
| Graphite Glaze (added) (.20%) | 0.011 |

REACTION PRODUCTS POSTULATED:

| | WEIGHT |
|--------------------------|------------|
| Carbon Dioxide (26.82%) | 1.48 grams |
| Carbon Monoxide (24.12%) | 1.33 |
| Water (25.46%) | 1.4 |
| Hydrogen (8.60%) | .474 |
| Nitrogen (14.99%) | .826 |

The M880 propulsion system uses a 12 gauge shot gun shell filled with 1.67 grams of double base propellant, while the M879 uses the M299 ignition cartridge containing 6.8 grams of M9 flake propellant and four M220 increment containers containing a total of 155 grams on M38 ball powder. As a result, the M880 propulsion system produces considerably less reaction products than the M879.

The M775 fuze (M880) has the same spotting charge (SW592) pyrotechnic signature charge as the M751 fuze (M879). However, the M775 fuze also incorporates inert diatomaceous earth and has six grams less of the SW592 composition (12 grams vs 18 grams), and thus produces less reaction products than the M751 fuze.

The M880 Short Range Practice Cartridge is adequately covered by the referenced M879 Environmental Assessment. The M880 Short Range Practice Cartridge and Refurbishment Kits will result in reduced environmental impacts due to the performance differences between the M880 and the M879 practice cartridges, as discussed in the preceding paragraphs.

See attached sheet for the reaction products of the M879 Full Range Practice Cartridge.

2. Does the proposal conform with installation Master Plan?

☒ Yes ☐ No (discuss)

3. Would proposed project alter land use on the installation?

☐ Yes (discuss) ☒ No

MEMORANDUM FOR Capt. T. Norris
SUBJECT: Energetic Material Information for 5.56mm
Ammunition

1. Reference Phoncon of 12 Mar 96
2. As discussed in the referenced Phoncon, I am forwarding you the subject information. I will provide you with the products of combustion of these materials hopefully within the next few days. This is a computer simulation of what compounds would be generated upon ignition.
3. The approximate amount of these materials used per cartridge is as follows:

| | |
|---------------------|-------------|
| Primer mix (FA-956) | .380 Grains |
| Propellant (all) | 28.5 Grains |
| Tracer Mix(R-284) | 1.2 Grains |
| Igniter Mix (I-560) | 1.2 Grains |
| Igniter Mix (I-561) | 1.0 Grains |

4. The WC844 Propellant is used in the M193 Ball, M196 Tracer, M855 Ball and M856 Tracer. The WC814 Propellant is only used in the M200 Blank round.
5. The enclosed Bullet drawing no. 10542726 shows how these tracer/igniter mixes are used. The Igniter mix I-559 shown on this drawing is not used. The I-56i is used in it's place.
6. If you have any questions concerning the information provided, or require further assistance, please contact the undersigned on DSN 880-6497 or Commercial (201) 724-6497.

Military Applications

HC smoke is used by the U.S. military in a wide variety of munitions, some of which are shown in Table 5-1. HC smoke is produced by burning a mixture containing roughly equal parts of HCE and ZnO and approximately 6% granular aluminum.

Combustion Products

The smoke mixture in a smoke bomb or grenade is initially ignited by a pyrotechnic starter mixture. The reaction is self-perpetuating and exothermic. The overall reaction was summarized by Cichowicz (1983):

Another reaction produces carbon monoxide instead of solid carbon. ZnCl_2 leaves the reaction zone as a hot vapor. On cooling below the condensation point, it nucleates to form an aerosol that rapidly absorbs water from the surrounding atmosphere. Hydrated ZnCl_2 particles then scatter light, thereby obscuring vision. Because of ZnCl_2 's affinity for water, the aerosol likely consists of the hydrated forms of ZnCl_2 under most atmospheric conditions (Katz et al. 1980). A starter mixture containing silicon, potassium nitrate, charcoal, iron oxide, granular aluminum, cellulose nitrate, and acetone, which is required to initiate the reaction, might generate very small amounts of other airborne contaminants. However, the acute toxic effects of exposure to HC smoke are considered to arise primarily from inhalation of the ZnCl_2 component, which comprises almost two thirds of the total mass of HC smoke (Table 5-2). All measurements of HC smoke are expressed in this chapter as milligrams of ZnCl_2 , unless noted otherwise.

The munitions listed in Table 5-1 all use slightly different chemical mixtures (Novak et al. 1987). An analysis of trace mate-

^aAll HC smokes are type C, which contains granular aluminum, hexachloroethane, and zinc oxide. Other types of HC smoke were used in the early years of smoke generation.

^bTime to functioning after release of safety lever.

^cNo future production for the M84A1 was planned as of 1983.

^dM116A1 was completing its production life cycle in 1983 and would be replaced by XM 825 white phosphorus fill.

|-----------------------------|----------------------------|
| Zinc chloride | 62.5 |
| Zinc oxide | 9.6 |
| Iron oxide ^b | 10.7 |
| Aluminum oxide ^b | 5.4 |
| Lead oxide ^b | 1.0 |
| Total particulate phase | 89.2 |
| Chlorinated vapors | 10.8 |

^aThe analysis does not take into account any liquid water that associates with ZnCl₂.

^bThese metals were assumed to be present as the oxide for purposes of calculating the mass fraction.

Source: DeVaul et al. (1989).

rials in HC smoke mixtures found common zinc impurities (Katz et al., 1980). Arsenic ranged from 0.13 to 5.0 microgram per gram (µg/g), mercury from 0.35 to 0.60 µg/g, cadmium from 53 to 1,523 µg/g, and lead from 50 to 858 µg/g. The cadmium and lead concentrations displayed a strong negative correlation.

Trace gas-phase products were measured in a field test of a standard M5-HCE 30-lb smoke pot (Katz et al. 1980). Table 5-3 shows the resulting gas-phase products at two distances from the pot. Laboratory tests showed that hydrogen chloride (HCl) vapor formation decreased with increasing relative humidity (Katz et al. 1980). Because the field test was performed at -2°C, humidity was probably low. Thus, HCl vapor concentrations shown in Table 5-3 could be much higher than those produced under more humid conditions. However, Katz et al. (1980) speculated that under humid conditions, HCl is absorbed from the vapor phase into ZnCl₂ and water aerosol particles. Therefore, with increasing humidity, exposure of respiratory tissue to HCl might shift to lower portions of the lung, because small aerosol particles can penetrate to the lower lung and vapor can be removed readily from incoming air in the upper airways. During four field tests, estimated chlorine (Cl₂) production ranged from 3 to 19 mg/g of mixture combusted.

Aerosol formation was down HC smoke pots (Katz et al. 1980). The count-mean diameters were 0.3 µm, respectively, and served size distribution was bimodal at higher concentrations (<3 × 10⁶ particles per cubic centimeter). As the aerosols age and count-mean diameter decreased by a factor of 10.

Laboratory-produced and Cl⁻¹ (Katz et al. 1980) 0.49% to 4.06% of the Zn content ranged from 0.01 to 0.02% in the unburned mixture.

Aerosol formation was studied in a chamber using scaled-down HC smoke pots (Katz et al. 1980). The mass-median and the count-mean diameters produced were approximately 0.4 μ m and 0.3 μ m, respectively, averaged over 29 experiments. The observed size distribution was log-normal at lower initial particle concentrations ($<3 \times 10^6$ particles per cubic centimeter) and multimodal at higher concentrations. Relative humidity had no consistent effect on the total particulate concentration or the particle size. As the aerosols aged over a 2-hr period, the mass-median and count-mean diameters nearly doubled as the particle concentration decreased by a factor of about 6.

Laboratory-produced HC smoke consisted primarily of Zn⁺² and Cl⁻¹ (Katz et al. 1980). The aluminum content ranged from 0.49% to 4.06% of the Zn content, with a mean of 1.79%. The lead content ranged from 0.13 to 2.2 μ g/mg of Zn, and the cadmium content ranged from 0.18 to 5.0 μ g/mg of Zn. The ratios of both lead and cadmium to zinc were slightly higher than the ratios in the unburned mixture and were well correlated with them.
